## 2 UTP variables

```

theory utp-var
imports
  ../toolkit/utp-toolkit
  utp-parser-utils
begin

```

In this first UTP theory we set up variable, which are built on lenses. A large part of this theory is setting up the parser for UTP variable syntax.

### 2.1 Initial syntax setup

We will overload the square order relation with refinement and also the lattice operators so we will turn off these notations.

```

purge-notation
  Order.le (infixl  $\sqsubseteq_1$  50) and
  Lattice.sup ( $\sqcup_1$ - [90] 90) and
  Lattice.inf ( $\sqcap_1$ - [90] 90) and
  Lattice.join (infixl  $\sqcup_1$  65) and
  Lattice.meet (infixl  $\sqcap_1$  70) and
  Set.member (op :) and
  Set.member ((-/ : -) [51, 51] 50) and
  disj (infixr | 30) and
  conj (infixr & 35)

```

```

declare fst-vwb-lens [simp]
declare snd-vwb-lens [simp]
declare comp-vwb-lens [simp]

```

### 2.2 Variable foundations

This theory describes the foundational structure of UTP variables, upon which the rest of our model rests. We start by defining alphabets, which following [3, 4] in this shallow model are simply represented as types  $\alpha$ , though by convention usually a record type where each field

corresponds to a variable. UTP variables in this frame are simply modelled as lenses  $'a \Longrightarrow 'α$ , where the view type  $'a$  is the variable type, and the source type  $'α$  is the alphabet or state-space type.

We define some lifting functions for variables to create input and output variables. These simply lift the alphabet to a tuple type since relations will ultimately be defined by a tuple alphabet.

**definition**  $in-var :: ('a \Longrightarrow 'α) \Rightarrow ('a \Longrightarrow 'α \times 'β)$  **where**  
 $[lens-defs]: in-var\ x = x ;_L fst_L$

**definition**  $out-var :: ('a \Longrightarrow 'β) \Rightarrow ('a \Longrightarrow 'α \times 'β)$  **where**  
 $[lens-defs]: out-var\ x = x ;_L snd_L$

Variables can also be used to effectively define sets of variables. Here we define the the universal alphabet ( $\Sigma$ ) to be the bijective lens  $1_L$ . This characterises the whole of the source type, and thus is effectively the set of all alphabet variables.

**abbreviation** (*input*)  $univ-alpha :: ('α \Longrightarrow 'α) (\Sigma)$  **where**  
 $univ-alpha \equiv 1_L$

The next construct is vacuous and simply exists to help the parser distinguish predicate variables from input and output variables.

**definition**  $pr-var :: ('a \Longrightarrow 'β) \Rightarrow ('a \Longrightarrow 'β)$  **where**  
 $[lens-defs]: pr-var\ x = x$

## 2.3 Variable lens properties

We can now easily show that our UTP variable construction are various classes of well-behaved lens .

**lemma**  $in-var-weak-lens [simp]:$   
 $weak-lens\ x \Longrightarrow weak-lens\ (in-var\ x)$   
**by** ( $simp\ add: comp-weak-lens\ in-var-def$ )

**lemma**  $in-var-semi-uvar [simp]:$   
 $mwb-lens\ x \Longrightarrow mwb-lens\ (in-var\ x)$   
**by** ( $simp\ add: comp-mwb-lens\ in-var-def$ )

**lemma**  $pr-var-weak-lens [simp]:$   
 $weak-lens\ x \Longrightarrow weak-lens\ (pr-var\ x)$   
**by** ( $simp\ add: pr-var-def$ )

**lemma**  $pr-var-mwb-lens [simp]:$   
 $mwb-lens\ x \Longrightarrow mwb-lens\ (pr-var\ x)$   
**by** ( $simp\ add: pr-var-def$ )

**lemma**  $pr-var-vwb-lens [simp]:$   
 $vwb-lens\ x \Longrightarrow vwb-lens\ (pr-var\ x)$   
**by** ( $simp\ add: pr-var-def$ )

**lemma**  $in-var-uvar [simp]:$   
 $vwb-lens\ x \Longrightarrow vwb-lens\ (in-var\ x)$   
**by** ( $simp\ add: in-var-def$ )

**lemma**  $out-var-weak-lens [simp]:$   
 $weak-lens\ x \Longrightarrow weak-lens\ (out-var\ x)$   
**by** ( $simp\ add: comp-weak-lens\ out-var-def$ )

**lemma** *out-var-semi-uvar* [simp]:  
 $mwb\text{-}lens\ x \implies mwb\text{-}lens\ (out\text{-}var\ x)$   
**by** (simp add: comp-mwb-lens out-var-def)

**lemma** *out-var-uvar* [simp]:  
 $vwb\text{-}lens\ x \implies vwb\text{-}lens\ (out\text{-}var\ x)$   
**by** (simp add: out-var-def)

Moreover, we can show that input and output variables are independent, since they refer to different sections of the alphabet.

**lemma** *in-out-indep* [simp]:  
 $in\text{-}var\ x \bowtie out\text{-}var\ y$   
**by** (simp add: lens-indep-def in-var-def out-var-def fst-lens-def snd-lens-def lens-comp-def)

**lemma** *out-in-indep* [simp]:  
 $out\text{-}var\ x \bowtie in\text{-}var\ y$   
**by** (simp add: lens-indep-def in-var-def out-var-def fst-lens-def snd-lens-def lens-comp-def)

**lemma** *in-var-indep* [simp]:  
 $x \bowtie y \implies in\text{-}var\ x \bowtie in\text{-}var\ y$   
**by** (simp add: in-var-def out-var-def)

**lemma** *out-var-indep* [simp]:  
 $x \bowtie y \implies out\text{-}var\ x \bowtie out\text{-}var\ y$   
**by** (simp add: out-var-def)

**lemma** *pr-var-indeps* [simp]:  
 $x \bowtie y \implies pr\text{-}var\ x \bowtie y$   
 $x \bowtie y \implies x \bowtie pr\text{-}var\ y$   
**by** (simp-all add: pr-var-def)

**lemma** *prod-lens-indep-in-var* [simp]:  
 $a \bowtie x \implies a \times_L b \bowtie in\text{-}var\ x$   
**by** (metis in-var-def in-var-indep out-in-indep out-var-def plus-pres-lens-indep prod-as-plus)

**lemma** *prod-lens-indep-out-var* [simp]:  
 $b \bowtie x \implies a \times_L b \bowtie out\text{-}var\ x$   
**by** (metis in-out-indep in-var-def out-var-def out-var-indep plus-pres-lens-indep prod-as-plus)

**lemma** *in-var-pr-var* [simp]:  
 $in\text{-}var\ (pr\text{-}var\ x) = in\text{-}var\ x$   
**by** (simp add: pr-var-def)

**lemma** *out-var-pr-var* [simp]:  
 $out\text{-}var\ (pr\text{-}var\ x) = out\text{-}var\ x$   
**by** (simp add: pr-var-def)

**lemma** *pr-var-idem* [simp]:  
 $pr\text{-}var\ (pr\text{-}var\ x) = pr\text{-}var\ x$   
**by** (simp add: pr-var-def)

**lemma** *pr-var-lens-plus* [simp]:  
 $pr\text{-}var\ (x +_L y) = (x +_L y)$   
**by** (simp add: pr-var-def)

**lemma** *pr-var-lens-comp-1* [simp]:  
 $pr\text{-}var\ x\ ;_L\ y = pr\text{-}var\ (x\ ;_L\ y)$   
**by** (simp add: pr-var-def)

**lemma** *in-var-plus* [simp]:  $in\text{-}var\ (x +_L y) = in\text{-}var\ x +_L in\text{-}var\ y$   
**by** (simp add: in-var-def plus-lens-distr)

**lemma** *out-var-plus* [simp]:  $out\text{-}var\ (x +_L y) = out\text{-}var\ x +_L out\text{-}var\ y$   
**by** (simp add: out-var-def plus-lens-distr)

Similar properties follow for sublens

**lemma** *in-var-sublens* [simp]:  
 $y \subseteq_L x \implies in\text{-}var\ y \subseteq_L in\text{-}var\ x$   
**by** (metis (no-types, hide-lams) in-var-def lens-comp-assoc sublens-def)

**lemma** *out-var-sublens* [simp]:  
 $y \subseteq_L x \implies out\text{-}var\ y \subseteq_L out\text{-}var\ x$   
**by** (metis (no-types, hide-lams) out-var-def lens-comp-assoc sublens-def)

**lemma** *pr-var-sublens* [simp]:  
 $y \subseteq_L x \implies pr\text{-}var\ y \subseteq_L pr\text{-}var\ x$   
**by** (simp add: pr-var-def)

## 2.4 Lens simplifications

We also define some lookup abstraction simplifications.

**lemma** *var-lookup-in* [simp]:  $lens\text{-}get\ (in\text{-}var\ x)\ (A, A') = lens\text{-}get\ x\ A$   
**by** (simp add: in-var-def fst-lens-def lens-comp-def)

**lemma** *var-lookup-out* [simp]:  $lens\text{-}get\ (out\text{-}var\ x)\ (A, A') = lens\text{-}get\ x\ A'$   
**by** (simp add: out-var-def snd-lens-def lens-comp-def)

**lemma** *var-update-in* [simp]:  $lens\text{-}put\ (in\text{-}var\ x)\ (A, A')\ v = (lens\text{-}put\ x\ A\ v, A')$   
**by** (simp add: in-var-def fst-lens-def lens-comp-def)

**lemma** *var-update-out* [simp]:  $lens\text{-}put\ (out\text{-}var\ x)\ (A, A')\ v = (A, lens\text{-}put\ x\ A'\ v)$   
**by** (simp add: out-var-def snd-lens-def lens-comp-def)

## 2.5 Syntax translations

In order to support nice syntax for variables, we here set up some translations. The first step is to introduce a collection of non-terminals.

**nonterminal** *svid* **and** *svids* **and** *svar* **and** *svars* **and** *salpha*

These non-terminals correspond to the following syntactic entities. Non-terminal *svid* is an atomic variable identifier, and *svids* is a list of identifier. *svar* is a decorated variable, such as an input or output variable, and *svars* is a list of decorated variables. *salpha* is an alphabet or set of variables. Such sets can be constructed only through lens composition due to typing restrictions. Next we introduce some syntax constructors.

**syntax** — Identifiers

-*svid* ::  $id \Rightarrow svid\ (-\ [999]\ 999)$   
-*svid-unit* ::  $svid \Rightarrow svids\ (-)$

```

-svid-list   :: svid  $\Rightarrow$  svids  $\Rightarrow$  svids (-, / -)
-svid-alpha :: svid (v)
-svid-dot   :: svid  $\Rightarrow$  svid  $\Rightarrow$  svid (:- [998,999] 998)

```

A variable identifier can either be a HOL identifier, the complete set of variables in the alphabet **v**, or a composite identifier separated by colons, which corresponds to a sort of qualification. The final option is effectively a lens composition.

**syntax** — Decorations

```

-spvar      :: svid  $\Rightarrow$  svar (&- [990] 990)
-sinvar     :: svid  $\Rightarrow$  svar ($- [990] 990)
-soutvar    :: svid  $\Rightarrow$  svar ($-' [990] 990)

```

A variable can be decorated with an ampersand, to indicate it is a predicate variable, with a dollar to indicate its an unprimed relational variable, or a dollar and “acute” symbol to indicate its a primed relational variable. Isabelle’s parser is extensible so additional decorations can be and are added later.

**syntax** — Variable sets

```

-salphaid   :: svid  $\Rightarrow$  salpha (- [990] 990)
-salphavar  :: svar  $\Rightarrow$  salpha (- [990] 990)
-salphaparen :: salpha  $\Rightarrow$  salpha ('(-'))
-salphacomp :: salpha  $\Rightarrow$  salpha  $\Rightarrow$  salpha (infixr ; 75)
-salphaprod :: salpha  $\Rightarrow$  salpha  $\Rightarrow$  salpha (infixr  $\times$  85)
-salpha-all :: salpha ( $\Sigma$ )
-salpha-none :: salpha ( $\emptyset$ )
-svar-nil   :: svar  $\Rightarrow$  svars (-)
-svar-cons  :: svar  $\Rightarrow$  svars  $\Rightarrow$  svars (-, / -)
-salphaset  :: svars  $\Rightarrow$  salpha ({-})
-salphamk   :: logic  $\Rightarrow$  salpha

```

The terminals of an alphabet are either HOL identifiers or UTP variable identifiers. We support two ways of constructing alphabets; by composition of smaller alphabets using a semi-colon or by a set-style construction  $\{a, b, c\}$  with a list of UTP variables.

**syntax** — Quotations

```

-ualpha-set :: svars  $\Rightarrow$  logic ({-} $\alpha$ )
-svar       :: svar  $\Rightarrow$  logic ('(-') $v$ )

```

For various reasons, the syntax constructors above all yield specific grammar categories and will not parse at the HOL top level (basically this is to do with us wanting to reuse the syntax for expressions). As a result we provide some quotation constructors above.

Next we need to construct the syntax translations rules. First we need a few polymorphic constants.

**consts**

```

svar :: 'v  $\Rightarrow$  'e
ivar :: 'v  $\Rightarrow$  'e
ovar :: 'v  $\Rightarrow$  'e

```

**ad hoc-overloading**

```

svar pr-var and ivar in-var and ovar out-var

```

The functions above turn a representation of a variable (type 'v), including its name and type, into some lens type 'e. *svar* constructs a predicate variable, *ivar* and input variables, and *ovar* and output variable. The functions bridge between the model and encoding of the variable and its interpretation as a lens in order to integrate it into the general lens-based framework.

Overriding these functions is then all we need to make use of any kind of variables in terms of interfacing it with the system. Although in core UTP variables are always modelled using record field, we can overload these constants to allow other kinds of variables, such as deep variables with explicit syntax and type information.

Finally, we set up the translations rules.

#### translations

— Identifiers

*-svid*  $x \rightarrow x$

*-svid-alpha*  $\Rightarrow \Sigma$

*-svid-dot*  $x\ y \rightarrow y\ ;_L\ x$

— Decorations

*-spvar*  $\Sigma \leftarrow \text{CONST svar CONST id-lens}$

*-sinvar*  $\Sigma \leftarrow \text{CONST ivar } 1_L$

*-soutvar*  $\Sigma \leftarrow \text{CONST ovar } 1_L$

*-spvar*  $(\text{-svid-dot } x\ y) \leftarrow \text{CONST svar (CONST lens-comp } y\ x)$

*-sinvar*  $(\text{-svid-dot } x\ y) \leftarrow \text{CONST ivar (CONST lens-comp } y\ x)$

*-soutvar*  $(\text{-svid-dot } x\ y) \leftarrow \text{CONST ovar (CONST lens-comp } y\ x)$

*-svid-dot*  $(\text{-svid-dot } x\ y)\ z \leftarrow \text{-svid-dot (CONST lens-comp } y\ x)\ z$

*-spvar*  $x \Rightarrow \text{CONST svar } x$

*-sinvar*  $x \Rightarrow \text{CONST ivar } x$

*-soutvar*  $x \Rightarrow \text{CONST ovar } x$

— Alphabets

*-salphaparen*  $a \rightarrow a$

*-salphaid*  $x \rightarrow x$

*-salphacomp*  $x\ y \rightarrow x\ +_L\ y$

*-salphaprod*  $a\ b \Rightarrow a \times_L b$

*-salphavar*  $x \rightarrow x$

*-svar-nil*  $x \rightarrow x$

*-svar-cons*  $x\ xs \rightarrow x\ +_L\ xs$

*-salphaset*  $A \rightarrow A$

$(\text{-svar-cons } x\ (\text{-salphamk } y)) \leftarrow \text{-salphamk } (x\ +_L\ y)$

$x \leftarrow \text{-salphamk } x$

*-salpha-all*  $\Rightarrow 1_L$

*-salpha-none*  $\Rightarrow 0_L$

— Quotations

*-ualpha-set*  $A \rightarrow A$

*-svar*  $x \rightarrow x$

The translation rules mainly convert syntax into lens constructions, using a mixture of lens operators and the bespoke variable definitions. Notably, a colon variable identifier qualification becomes a lens composition, and variable sets are constructed using len sum. The translation rules are carefully crafted to ensure both parsing and pretty printing.

Finally we create the following useful utility translation function that allows us to construct a UTP variable (lens) type given a return and alphabet type.

#### syntax

*-uvar-ty*  $:: \text{type} \Rightarrow \text{type} \Rightarrow \text{type}$

#### parse-translation <

*let*

*fun uvar-ty-tr*  $[ty] = \text{Syntax.const } @\{\text{type-syntax lens}\} \$ ty \$ \text{Syntax.const } @\{\text{type-syntax dummy}\}$

```

    | uvar-ty-tr ts = raise TERM (uvar-ty-tr, ts);
in [(@{syntax-const -uvar-ty}, K uvar-ty-tr)] end

```

end

### 3 UTP expressions

```

theory utp-expr
imports
  utp-var
begin

```

#### 3.1 Expression type

**purge-notation** *BNF-Def.convolve* ( $((-, / -))$ )

Before building the predicate model, we will build a model of expressions that generalise alphabetised predicates. Expressions are represented semantically as mapping from the alphabet  $'\alpha$  to the expression's type  $'a$ . This general model will allow us to unify all constructions under one type. The majority definitions in the file are given using the *lifting* package [6], which allows us to reuse much of the existing library of HOL functions.

**typedef**  $('t, 'a) \text{ uexpr} = \text{UNIV} :: ('a \Rightarrow 't) \text{ set} ..$

**setup-lifting** *type-definition-uexpr*

**notation** *Rep-uexpr* ( $\llbracket - \rrbracket_e$ )

**lemma** *uexpr-eq-iff*:

$e = f \iff (\forall b. \llbracket e \rrbracket_e b = \llbracket f \rrbracket_e b)$   
**using** *Rep-uexpr-inject*[*of e f, THEN sym*] **by** (*auto*)

The term  $\llbracket e \rrbracket_e b$  effectively refers to the semantic interpretation of the expression under the state-space valuation (or variables binding)  $b$ . It can be used, in concert with the lifting package, to interpret UTP constructs to their HOL equivalents. We create some theorem sets to store such transfer theorems.

**named-theorems** *ueval and lit-simps and lit-norm*

#### 3.2 Core expression constructs

A variable expression corresponds to the lens *get* function associated with a variable. Specifically, given a lens the expression always returns that portion of the state-space referred to by the lens.

**lift-definition**  $\text{var} :: ('t \Rightarrow 'a) \Rightarrow ('t, 'a) \text{ uexpr}$  **is** *lens-get* .

A literal is simply a constant function expression, always returning the same value for any binding.

**lift-definition**  $\text{lit} :: 't \Rightarrow ('t, 'a) \text{ uexpr}$  **is**  $\lambda v b. v$  .

We define lifting for unary, binary, ternary, and quaternary expression constructs, that simply take a HOL function with correct number of arguments and apply it function to all possible results of the expressions.

**lift-definition**  $uop :: ('a \Rightarrow 'b) \Rightarrow ('a, 'α) uexpr \Rightarrow ('b, 'α) uexpr$

**is**  $\lambda f e b. f (e b) .$

**lift-definition**  $bop ::$

$('a \Rightarrow 'b \Rightarrow 'c) \Rightarrow ('a, 'α) uexpr \Rightarrow ('b, 'α) uexpr \Rightarrow ('c, 'α) uexpr$

**is**  $\lambda f u v b. f (u b) (v b) .$

**lift-definition**  $trop ::$

$('a \Rightarrow 'b \Rightarrow 'c \Rightarrow 'd) \Rightarrow ('a, 'α) uexpr \Rightarrow ('b, 'α) uexpr \Rightarrow ('c, 'α) uexpr \Rightarrow ('d, 'α) uexpr$

**is**  $\lambda f u v w b. f (u b) (v b) (w b) .$

**lift-definition**  $qtop ::$

$('a \Rightarrow 'b \Rightarrow 'c \Rightarrow 'd \Rightarrow 'e) \Rightarrow$

$('a, 'α) uexpr \Rightarrow ('b, 'α) uexpr \Rightarrow ('c, 'α) uexpr \Rightarrow ('d, 'α) uexpr \Rightarrow$

$('e, 'α) uexpr$

**is**  $\lambda f u v w x b. f (u b) (v b) (w b) (x b) .$

We also define a UTP expression version of function ( $\lambda$ ) abstraction, that takes a function producing an expression and produces an expression producing a function.

**lift-definition**  $ulambda :: ('a \Rightarrow ('b, 'α) uexpr) \Rightarrow ('a \Rightarrow 'b, 'α) uexpr$

**is**  $\lambda f A x. f x A .$

We set up syntax for the conditional. This is effectively an infix version of if-then-else where the condition is in the middle.

**abbreviation**  $cond ::$

$('a, 'α) uexpr \Rightarrow (bool, 'α) uexpr \Rightarrow ('a, 'α) uexpr \Rightarrow ('a, 'α) uexpr$

$((3- \triangleleft - \triangleright / -) [52, 0, 53] 52)$

**where**  $P \triangleleft b \triangleright Q \equiv trop \text{ If } b P Q$

UTP expression is equality is simply HOL equality lifted using the  $bop$  binary expression constructor.

**definition**  $eq-upred :: ('a, 'α) uexpr \Rightarrow ('a, 'α) uexpr \Rightarrow (bool, 'α) uexpr$

**where**  $eq-upred x y = bop \text{ HOL.eq } x y$

We define syntax for expressions using adhoc-overloading – this allows us to later define operators on different types if necessary (e.g. when adding types for new UTP theories).

**consts**

$ulit :: 't \Rightarrow 'e (\ll-\gg)$

$ueq :: 'a \Rightarrow 'a \Rightarrow 'b (\text{infixl } =_u 50)$

**adhoc-overloading**

$ulit \text{ lit and}$

$ueq \text{ eq-upred}$

A literal is the expression  $\ll v \gg$ , where  $v$  is any HOL term. Actually, the literal construct is very versatile and also allows us to refer to HOL variables within UTP expressions, and has a variety of other uses. It can therefore also be considered as a kind of quotation mechanism.

We also set up syntax for UTP variable expressions.

**syntax**

$-uuvar :: svar \Rightarrow logic (-)$

**translations**

$-uuvar x == CONST var x$

Since we already have a parser for variables, we can directly reuse it and simply apply the  $var$  expression construct to lift the resulting variable to an expression.

### 3.3 Type class instantiations

Isabelle/HOL of course provides a large hierarchy of type classes that provide constructs such as numerals and the arithmetic operators. Fortunately we can directly make use of these for UTP expressions, and thus we now perform a long list of appropriate instantiations. We first lift the core arithmetic constants and operators using a mixture of literals, unary, and binary expression constructors.

```
instantiation uexpr :: (zero, type) zero
begin
  definition zero-uexpr-def:  $0 = \text{lit } 0$ 
instance ..
end
```

```
instantiation uexpr :: (one, type) one
begin
  definition one-uexpr-def:  $1 = \text{lit } 1$ 
instance ..
```

**end**

```
instantiation uexpr :: (plus, type) plus
begin
  definition plus-uexpr-def:  $u + v = \text{bop } (op +) u v$ 
instance ..
end
```

It should be noted that instantiating the unary minus class, *uminus*, will also provide negation UTP predicates later.

```
instantiation uexpr :: (uminus, type) uminus
begin
  definition uminus-uexpr-def:  $- u = \text{uop } \text{uminus } u$ 
instance ..
end
```

```
instantiation uexpr :: (minus, type) minus
begin
  definition minus-uexpr-def:  $u - v = \text{bop } (op -) u v$ 
instance ..
end
```

```
instantiation uexpr :: (times, type) times
begin
  definition times-uexpr-def:  $u * v = \text{bop } (op *) u v$ 
instance ..
end
```

```
instance uexpr :: (Rings.dvd, type) Rings.dvd ..
```

```
instantiation uexpr :: (divide, type) divide
begin
  definition divide-uexpr :: ('a, 'b) uexpr  $\Rightarrow$  ('a, 'b) uexpr  $\Rightarrow$  ('a, 'b) uexpr where
    divide-uexpr u v = bop divide u v
instance ..
end
```

```

instantiation uexpr :: (inverse, type) inverse
begin
  definition inverse-uexpr :: ('a, 'b) uexpr  $\Rightarrow$  ('a, 'b) uexpr
  where inverse-uexpr u = uop inverse u
instance ..
end

```

```

instantiation uexpr :: (modulo, type) modulo
begin
  definition mod-uexpr-def: u mod v = bop (op mod) u v
instance ..
end

```

```

instantiation uexpr :: (sgn, type) sgn
begin
  definition sgn-uexpr-def: sgn u = uop sgn u
instance ..
end

```

```

instantiation uexpr :: (abs, type) abs
begin
  definition abs-uexpr-def: abs u = uop abs u
instance ..
end

```

Once we've set up all the core constructs for arithmetic, we can also instantiate the type classes for various algebras, including groups and rings. The proofs are done by definitional expansion, the *transfer* tactic, and then finally the theorems of the underlying HOL operators. This is mainly routine, so we don't comment further.

```

instance uexpr :: (semigroup-mult, type) semigroup-mult
  by (intro-classes) (simp add: times-uexpr-def one-uexpr-def, transfer, simp add: mult.assoc)+

```

```

one-uexpr-def, transfer, simp add: fun-eq-iff) +

```

We can also define the order relation on expressions. Now, unlike the previous group and ring constructs, the order relations  $op \leq$  and  $op \leq$  return a *bool* type. This order is not therefore the lifted order which allows us to compare the valuation of two expressions, but rather the order on expressions themselves. Notably, this instantiation will later allow us to talk about predicate refinements and complete lattices.

```

instantiation uexpr :: (ord, type) ord
begin
  lift-definition less-eq-uexpr :: ('a, 'b) uexpr  $\Rightarrow$  ('a, 'b) uexpr  $\Rightarrow$  bool
  is  $\lambda P Q. (\forall A. P A \leq Q A)$  .
  definition less-uexpr :: ('a, 'b) uexpr  $\Rightarrow$  ('a, 'b) uexpr  $\Rightarrow$  bool
  where less-uexpr P Q = (P  $\leq$  Q  $\wedge$   $\neg$  Q  $\leq$  P)
instance ..
end

```

UTP expressions whose return type is a partial ordered type, are also partially ordered as the following instantiation demonstrates.

```

instance uexpr :: (order, type) order
proof
  fix x y z :: ('a, 'b) uexpr
  show (x < y) = (x  $\leq$  y  $\wedge$   $\neg$  y  $\leq$  x) by (simp add: less-uexpr-def)
  show x  $\leq$  x by (transfer, auto)
  show x  $\leq$  y  $\implies$  y  $\leq$  z  $\implies$  x  $\leq$  z
    by (transfer, blast intro: order.trans)
  show x  $\leq$  y  $\implies$  y  $\leq$  x  $\implies$  x = y
    by (transfer, rule ext, simp add: eq-iff)
qed

```

We also lift the properties from certain ordered groups.

```

instance uexpr :: (ordered-ab-group-add, type) ordered-ab-group-add
  by (intro-classes) (simp add: plus-uexpr-def, transfer, simp)

instance uexpr :: (ordered-ab-group-add-abs, type) ordered-ab-group-add-abs
  apply (intro-classes)
    apply (simp add: abs-uexpr-def zero-uexpr-def plus-uexpr-def uminus-uexpr-def, transfer, simp
add: abs-ge-self abs-le-iff abs-triangle-ineq) +
    apply (metis ab-group-add-class.ab-diff-conv-add-uminus abs-ge-minus-self abs-ge-self add-mono-thms-linordered-semiri
done)

```

The following instantiation sets up numerals. This will allow us to have Isabelle number representations (i.e. 3,7,42,198 etc.) to UTP expressions directly.

```

instance uexpr :: (numeral, type) numeral
  by (intro-classes, simp add: plus-uexpr-def, transfer, simp add: add.assoc)

```

The following two theorems also set up interpretation of numerals, meaning a UTP numeral can always be converted to a HOL numeral.

```
lemma numeral-uepr-rep-eq:  $\llbracket \text{numeral } x \rrbracket_e b = \text{numeral } x$ 
apply (induct x)
apply (simp add: lit.rep-eq one-uepr-def)
apply (simp add: bop.rep-eq numeral-Bit0 plus-uepr-def)
apply (simp add: bop.rep-eq lit.rep-eq numeral-code(3) one-uepr-def plus-uepr-def)
done
```

```
lemma numeral-uepr-simp:  $\text{numeral } x = \llbracket \text{numeral } x \rrbracket_e$ 
by (simp add: uepr-eq-iff numeral-uepr-rep-eq lit.rep-eq)
```

The next theorem lifts powers.

```
lemma power-rep-eq:  $\llbracket P \wedge n \rrbracket_e = (\lambda b. \llbracket P \rrbracket_e b \wedge n)$ 
by (induct n, simp-all add: lit.rep-eq one-uepr-def bop.rep-eq times-uepr-def)
```

We can also lift a few trace properties from the class instantiations above using *transfer*.

```
lemma uepr-diff-zero [simp]:
fixes a :: ('α::trace, 'a) uepr
shows a - 0 = a
by (simp add: minus-uepr-def zero-uepr-def, transfer, auto)
```

```
lemma uepr-add-diff-cancel-left [simp]:
fixes a b :: ('α::trace, 'a) uepr
shows (a + b) - a = b
by (simp add: minus-uepr-def plus-uepr-def, transfer, auto)
```

### 3.4 Overloaded expression constructors

For convenience, we often want to utilise the same expression syntax for multiple constructs. This can be achieved using ad-hoc overloading. We create a number of polymorphic constants and then overload their definitions using appropriate implementations. In order for this to work, each collection must have its own unique type. Thus we do not use the HOL map type directly, but rather our own partial function type, for example.

```
consts
— Empty elements, for example empty set, nil list, 0...
uepr      :: 'f
— Function application, map application, list application...
uapply    :: 'f ⇒ 'k ⇒ 'v
— Function update, map update, list update...
uupd      :: 'f ⇒ 'k ⇒ 'v ⇒ 'f
— Domain of maps, lists...
uom       :: 'f ⇒ 'a set
— Range of maps, lists...
uran      :: 'f ⇒ 'b set
— Domain restriction
uomres    :: 'a set ⇒ 'f ⇒ 'f
— Range restriction
uranres   :: 'f ⇒ 'b set ⇒ 'f
— Collection cardinality
ucard     :: 'f ⇒ nat
— Collection summation
usums     :: 'f ⇒ 'a
```

— Construct a collection from a list of entries  
*uentries* ::  $'k \text{ set} \Rightarrow ('k \Rightarrow 'v) \Rightarrow 'f$

We need a function corresponding to function application in order to overload.

**definition** *fun-apply* ::  $('a \Rightarrow 'b) \Rightarrow ('a \Rightarrow 'b)$   
**where** *fun-apply* *f* *x* = *f* *x*

**declare** *fun-apply-def* [*simp*]

**definition** *ffun-entries* ::  $'k \text{ set} \Rightarrow ('k \Rightarrow 'v) \Rightarrow ('k, 'v) \text{ ffun}$  **where**  
*ffun-entries* *d* *f* = *graph-ffun*  $\{(k, f\ k) \mid k. k \in d\}$

We then set up the overloading for a number of useful constructs for various collections.

**ad hoc-overloading**

*uempty* 0 **and**  
*uapply* *fun-apply* **and** *uapply* *nth* **and** *uapply* *pfun-app* **and**  
*uapply* *ffun-app* **and**  
*upd* *pfun-upd* **and** *upd* *ffun-upd* **and** *upd* *list-augment* **and**  
*udom* *Domain* **and** *udom* *pdom* **and** *udom* *fdom* **and** *udom* *seq-dom* **and**  
*udom* *Range* **and** *uran* *pran* **and** *uran* *fran* **and** *uran* *set* **and**  
*udomres* *pdom-res* **and** *udomres* *fdom-res* **and**  
*uranres* *pran-res* **and** *udomres* *fran-res* **and**  
*ucard* *card* **and** *ucard* *pcard* **and** *ucard* *length* **and**  
*usums* *list-sum* **and** *usums* *Sum* **and** *usums* *pfun-sum* **and**  
*uentries* *pfun-entries* **and** *uentries* *ffun-entries*

### 3.5 Syntax translations

The follows a large number of translations that lift HOL functions to UTP expressions using the various expression constructors defined above. Much of the time we try to keep the HOL syntax but add a "u" subscript.

**abbreviation** (*input*) *ulens-override* *x* *f* *g*  $\equiv$  *lens-override* *f* *g* *x*

This operator allows us to get the characteristic set of a type. Essentially this is *UNIV*, but it retains the type syntactically for pretty printing.

**definition** *set-of* ::  $'a \text{ itself} \Rightarrow 'a \text{ set}$  **where**  
*set-of* *t* = *UNIV*

**translations**

0 <= *CONST* *uempty* — We have to do this so we don't see *uempty*. Is there a better way of printing?

We add new non-terminals for UTP tuples and maplets.

**nonterminal** *utuple-args* **and** *umaplet* **and** *umaplets*

**syntax** — Core expression constructs

-*ucoerce* :: *logic*  $\Rightarrow$  *type*  $\Rightarrow$  *logic* (**infix**  $:_u$  50)  
-*ulambda* :: *pttrn*  $\Rightarrow$  *logic*  $\Rightarrow$  *logic* ( $\lambda$  -  $\cdot$  - [*0*, *10*] *10*)  
-*ulens-ovrd* :: *logic*  $\Rightarrow$  *logic*  $\Rightarrow$  *salph*  $\Rightarrow$  *logic* ( $- \oplus - \text{on} -$  [*85*, *0*, *86*] *86*)  
-*ulens-get* :: *logic*  $\Rightarrow$  *svar*  $\Rightarrow$  *logic* ( $-:-$  [*900*, *901*] *901*)

**translations**

$\lambda$  *x*  $\cdot$  *p* == *CONST* *ulambda* ( $\lambda$  *x*. *p*)  
*x*  $:_u$  *'a* == *x* :: (*'a*, -) *uexpr*

$-ulens-ovrd\ f\ g\ a \Rightarrow CONST\ bop\ (CONST\ ulens-override\ a)\ f\ g$

## 3.8 Evaluation laws for expressions

We now collect together all the definitional theorems for expression constructs, and use them to build an evaluation strategy for expressions that we will later use to construct proof tactics for UTP predicates.

**lemmas** *ueval-defs* =

*zero-ueval-def*  
*one-ueval-def*  
*plus-ueval-def*  
*uminus-ueval-def*  
*minus-ueval-def*  
*times-ueval-def*  
*inverse-ueval-def*  
*divide-ueval-def*  
*sgn-ueval-def*  
*abs-ueval-def*  
*mod-ueval-def*  
*eq-upred-def*  
*numeral-ueval-simp*  
*ulim-left-def*  
*ulim-right-def*  
*ucont-on-def*

The following laws show how to evaluate the core expressions constructs in terms of which the above definitions are defined. Thus, using these theorems together, we can convert any UTP expression into a pure HOL expression. All these theorems are marked as *ueval* theorems which can be used for evaluation.

**lemma** *lit-ueval* [*ueval*]:  $\llbracket \langle x \rangle \rrbracket_e b = x$   
**by** (*transfer*, *simp*)

**lemma** *var-ueval* [*ueval*]:  $\llbracket \text{var } x \rrbracket_e b = \text{get}_x b$   
**by** (*transfer*, *simp*)

**lemma** *uop-ueval* [*ueval*]:  $\llbracket uop f x \rrbracket_e b = f (\llbracket x \rrbracket_e b)$   
**by** (*transfer*, *simp*)

**lemma** *bop-ueval* [*ueval*]:  $\llbracket bop f x y \rrbracket_e b = f (\llbracket x \rrbracket_e b) (\llbracket y \rrbracket_e b)$   
**by** (*transfer*, *simp*)

**lemma** *trop-ueval* [*ueval*]:  $\llbracket trop f x y z \rrbracket_e b = f (\llbracket x \rrbracket_e b) (\llbracket y \rrbracket_e b) (\llbracket z \rrbracket_e b)$   
**by** (*transfer*, *simp*)

**lemma** *qtop-ueval* [*ueval*]:  $\llbracket qtop f x y z w \rrbracket_e b = f (\llbracket x \rrbracket_e b) (\llbracket y \rrbracket_e b) (\llbracket z \rrbracket_e b) (\llbracket w \rrbracket_e b)$   
**by** (*transfer*, *simp*)

We also add all the definitional expressions to the evaluation theorem set.

**declare** *ueval-defs* [*ueval*]

### 3.9 Misc laws

We also prove a few useful algebraic and expansion laws for expressions.

**lemma** *uop-const* [simp]:  $uop\ id\ u = u$   
**by** (*transfer*, *simp*)

**lemma** *bop-const-1* [simp]:  $bop\ (\lambda x\ y.\ y)\ u\ v = v$   
**by** (*transfer*, *simp*)

**lemma** *bop-const-2* [simp]:  $bop\ (\lambda x\ y.\ x)\ u\ v = u$   
**by** (*transfer*, *simp*)

**lemma** *uinter-empty-1* [simp]:  $x \cap_u \{\}_u = \{\}_u$   
**by** (*transfer*, *simp*)

**lemma** *uinter-empty-2* [simp]:  $\{\}_u \cap_u x = \{\}_u$   
**by** (*transfer*, *simp*)

**lemma** *union-empty-1* [simp]:  $\{\}_u \cup_u x = x$   
**by** (*transfer*, *simp*)

**lemma** *uset-minus-empty* [simp]:  $x - \{\}_u = x$   
**by** (*simp* *add*: *uexpr-defs*, *transfer*, *simp*)

**lemma** *ulist-filter-empty* [simp]:  $x \downarrow_u \{\}_u = \langle \rangle$   
**by** (*transfer*, *simp*)

**lemma** *tail-cons* [simp]:  $tail_u(\langle x \rangle \hat{\ }_u xs) = xs$   
**by** (*transfer*, *simp*)

**lemma** *uconcat-units* [simp]:  $\langle \rangle \hat{\ }_u xs = xs\ xs\ \hat{\ }_u \langle \rangle = xs$   
**by** (*transfer*, *simp*)<sup>+</sup>

**lemma** *iter-0* [simp]:  $iter[0](t) = \langle \rangle$   
**by** (*transfer*, *simp* *add*: *zero-list-def*)

**lemma** *ufun-apply-lit* [simp]:  
 $\langle\!\langle f \rangle\!\rangle(\langle\!\langle x \rangle\!\rangle)_a = \langle\!\langle f(x) \rangle\!\rangle$   
**by** (*transfer*, *simp*)

### 3.10 Literalise tactics

The following tactic converts literal HOL expressions to UTP expressions and vice-versa via a collection of simplification rules. The two tactics are called "literalise", which converts UTP to expressions to HOL expressions – i.e. it pushes them into literals – and unliteralise that reverses this. We collect the equations in a theorem attribute called "lit\_simps".

**lemma** *lit-zero* [lit\_simps]:  $\langle\!\langle 0 \rangle\!\rangle = 0$  **by** (*simp* *add*: *ueval*)

**lemma** *lit-one* [lit\_simps]:  $\langle\!\langle 1 \rangle\!\rangle = 1$  **by** (*simp* *add*: *ueval*)

**lemma** *lit-numeral* [lit\_simps]:  $\langle\!\langle numeral\ n \rangle\!\rangle = numeral\ n$  **by** (*simp* *add*: *ueval*)

**lemma** *lit-uminus* [lit\_simps]:  $\langle\!\langle -\ x \rangle\!\rangle = -\ \langle\!\langle x \rangle\!\rangle$  **by** (*simp* *add*: *ueval*, *transfer*, *simp*)

**lemma** *lit-plus* [lit\_simps]:  $\langle\!\langle x + y \rangle\!\rangle = \langle\!\langle x \rangle\!\rangle + \langle\!\langle y \rangle\!\rangle$  **by** (*simp* *add*: *ueval*, *transfer*, *simp*)

**lemma** *lit-minus* [lit\_simps]:  $\langle\!\langle x - y \rangle\!\rangle = \langle\!\langle x \rangle\!\rangle - \langle\!\langle y \rangle\!\rangle$  **by** (*simp* *add*: *ueval*, *transfer*, *simp*)

**lemma** *lit-times* [lit\_simps]:  $\langle\!\langle x * y \rangle\!\rangle = \langle\!\langle x \rangle\!\rangle * \langle\!\langle y \rangle\!\rangle$  **by** (*simp* *add*: *ueval*, *transfer*, *simp*)

**lemma** *lit-divide* [lit\_simps]:  $\langle\!\langle x / y \rangle\!\rangle = \langle\!\langle x \rangle\!\rangle / \langle\!\langle y \rangle\!\rangle$  **by** (*simp* *add*: *ueval*, *transfer*, *simp*)

**lemma** *lit-div* [*lit-simps*]:  $\llbracket x \text{ div } y \rrbracket = \llbracket x \rrbracket \text{ div } \llbracket y \rrbracket$  **by** (*simp add: ueval, transfer, simp*)  
**lemma** *lit-power* [*lit-simps*]:  $\llbracket x \wedge n \rrbracket = \llbracket x \rrbracket \wedge n$  **by** (*simp add: lit.rep-eq power.rep-eq uexpr-eq-iff*)

**lemma** *lit-plus-appl* [*lit-norm*]:  $\llbracket op + \rrbracket (x)_a (y)_a = x + y$  **by** (*simp add: ueval, transfer, simp*)  
**lemma** *lit-minus-appl* [*lit-norm*]:  $\llbracket op - \rrbracket (x)_a (y)_a = x - y$  **by** (*simp add: ueval, transfer, simp*)  
**lemma** *lit-mult-appl* [*lit-norm*]:  $\llbracket op * \rrbracket (x)_a (y)_a = x * y$  **by** (*simp add: ueval, transfer, simp*)  
**lemma** *lit-divide-apply* [*lit-norm*]:  $\llbracket op / \rrbracket (x)_a (y)_a = x / y$  **by** (*simp add: ueval, transfer, simp*)

**lemma** *lit-fun-simps* [*lit-simps*]:  
 $\llbracket i \ x \ y \ z \ u \rrbracket = qtop \ i \ \llbracket x \rrbracket \ \llbracket y \rrbracket \ \llbracket z \rrbracket \ \llbracket u \rrbracket$   
 $\llbracket h \ x \ y \ z \rrbracket = trop \ h \ \llbracket x \rrbracket \ \llbracket y \rrbracket \ \llbracket z \rrbracket$   
 $\llbracket g \ x \ y \rrbracket = bop \ g \ \llbracket x \rrbracket \ \llbracket y \rrbracket$   
 $\llbracket f \ x \rrbracket = uop \ f \ \llbracket x \rrbracket$   
**by** (*transfer, simp*)+

In general unliteralising converts function applications to corresponding expression liftings. Since some operators, like  $+$  and  $*$ , have specific operators we also have to use  $0 = \llbracket u \rrbracket$

$1 = \llbracket 1 :: ?'a \rrbracket$   
 $?u + ?v = bop \ op \ + \ ?u \ ?v$   
 $- \ ?u = uop \ uminus \ ?u$   
 $?u - ?v = bop \ op \ - \ ?u \ ?v$   
 $?u * ?v = bop \ op \ * \ ?u \ ?v$   
 $inverse \ ?u = uop \ inverse \ ?u$   
 $?u \text{ div } ?v = bop \ op \ \text{div} \ ?u \ ?v$   
 $sgn \ ?u = uop \ sgn \ ?u$   
 $|?u| = uop \ abs \ ?u$   
 $?u \bmod ?v = bop \ op \ \bmod \ ?u \ ?v$   
 $(?x =_u ?y) = bop \ op \ = \ ?x \ ?y$   
 $numeral \ ?x = \llbracket numeral \ ?x \rrbracket$   
 $ulim-left = (\lambda p. \ Lim \ (at-left \ p))$   
 $ulim-right = (\lambda p. \ Lim \ (at-right \ p))$

$ucont-on = (\lambda f \ A. \ continuous-on \ A \ f)$  in reverse to correctly interpret these. Moreover, numerals must be handled separately by first simplifying them and then converting them into UTP expression numerals; hence the following two simplification rules.

**lemma** *lit-numeral-1*:  $uop \ numeral \ x = Abs-uexpr \ (\lambda b. \ numeral \ (\llbracket x \rrbracket_e \ b))$   
**by** (*simp add: uop-def*)

**lemma** *lit-numeral-2*:  $Abs-uexpr \ (\lambda b. \ numeral \ v) = numeral \ v$   
**by** (*metis lit.abs-eq lit-numeral*)

**method** *literalise* = (*unfold lit-simps [THEN sym]*)  
**method** *unliteralise* = (*unfold lit-simps uexpr-defs [THEN sym]*;  
*(unfold lit-numeral-1 ; (unfold ueval); (unfold lit-numeral-2)) ?*) +

The following tactic can be used to evaluate literal expressions. It first literalises UTP expressions, that is pushes as many operators into literals as possible. Then it tries to simplify, and final unliteralises at the end.

**method** *uexpr-simp uses* *simps* = (*(literalise) ?*, *simp add: lit-norm simps*, *(unliteralise) ?*)

```

lemma (1::int, 'α) uexpr) + <<2>> = 4 <=> <<3>> = 4
  apply (uexpr-simp) oops

end

```

## 4 Unrestriction

```

theory utp-unrest
  imports utp-expr
begin

```

### 4.1 Definitions and Core Syntax

Unrestriction is an encoding of semantic freshness that allows us to reason about the presence of variables in predicates without being concerned with abstract syntax trees. An expression  $p$  is unrestricted by lens  $x$ , written  $x \# p$ , if altering the value of  $x$  has no effect on the valuation of  $p$ . This is a sufficient notion to prove many laws that would ordinarily rely on an  $fv$  function.

Unrestriction was first defined in the work of Marcel Oliveira [10, 9] in his UTP mechanisation in *ProofPowerZ*. Our definition modifies his in that our variables are semantically characterised as lenses, and supported by the lens laws, rather than named syntactic entities. We effectively fuse the ideas from both Feliachi [3] and Oliveira's [9] mechanisations of the UTP, the former being also purely semantic in nature.

We first set up overloaded syntax for unrestricted, as several concepts will have this defined.

```

consts
  unrest :: 'a ⇒ 'b ⇒ bool

```

```

syntax
  -unrest :: salpha ⇒ logic ⇒ logic ⇒ logic (infix # 20)

```

```

translations
  -unrest x p == CONST unrest x p
  -unrest (-salphaset (-salphamk (x +L y))) P <== -unrest (x +L y) P

```

Our syntax translations support both variables and variable sets such that we can write down predicates like  $\&x \# P$  and also  $\{\&x, \&y, \&z\} \# P$ .

We set up a simple tactic for discharging unrestricted conjectures using a simplification set.

```

named-theorems unrest
method unrest-tac = (simp add: unrest)?

```

Unrestriction for expressions is defined as a lifted construct using the underlying lens operations. It states that lens  $x$  is unrestricted by expression  $e$  provided that, for any state-space binding  $b$  and variable valuation  $v$ , the value which the expression evaluates to is unaltered if we set  $x$  to  $v$  in  $b$ . In other words, we cannot effect the behaviour of  $e$  by changing  $x$ . Thus  $e$  does not observe the portion of state-space characterised by  $x$ . We add this definition to our overloaded constant.

```

lift-definition unrest-uexpr :: ('a ⇒ 'α) ⇒ ('b, 'α) uexpr ⇒ bool
is λ x e. ∀ b v. e (putx b v) = e b .

```

```

adhoc-overloading
  unrest unrest-uexpr

```

**lemma** *unrest-expr-alt-def*:

*weak-lens*  $x \implies (x \# P) = (\forall b \ b'. \llbracket P \rrbracket_e (b \oplus_L b' \text{ on } x) = \llbracket P \rrbracket_e b)$   
**by** (*transfer*, *metis lens-override-def weak-lens.put-get*)

## 4.2 Unrestriction laws

We now prove unrestriction laws for the key constructs of our expression model. Many of these depend on lens properties and so variously employ the assumptions *mwb-lens* and *vwb-lens*, depending on the number of assumptions from the lenses theory is required.

Firstly, we prove a general property – if  $x$  and  $y$  are both unrestricted in  $P$ , then their composition is also unrestricted in  $P$ . One can interpret the composition here as a union – if the two sets of variables  $x$  and  $y$  are unrestricted, then so is their union.

**lemma** *unrest-var-comp* [*unrest*]:

$\llbracket x \# P; y \# P \rrbracket \implies x; y \# P$   
**by** (*transfer*, *simp add: lens-defs*)

**lemma** *unrest-svar* [*unrest*]:  $(\&x \# P) \longleftrightarrow (x \# P)$

**by** (*transfer*, *simp add: lens-defs*)

No lens is restricted by a literal, since it returns the same value for any state binding.

**lemma** *unrest-lit* [*unrest*]:  $x \# \llbracket v \rrbracket$

**by** (*transfer*, *simp*)

If one lens is smaller than another, then any unrestriction on the larger lens implies unrestriction on the smaller.

**lemma** *unrest-sublens*:

**fixes**  $P :: ('a, 'α) \text{ uexpr}$   
**assumes**  $x \# P \ y \subseteq_L x$   
**shows**  $y \# P$   
**using** *assms*  
**by** (*transfer*, *metis (no-types, lifting) lens.select-convs(2) lens-comp-def sublens-def*)

If two lenses are equivalent, and thus they characterise the same state-space regions, then clearly unrestrictions over them are equivalent.

**lemma** *unrest-equiv*:

**fixes**  $P :: ('a, 'α) \text{ uexpr}$   
**assumes**  $\text{mwb-lens } y \ x \approx_L y \ x \ \# P$   
**shows**  $y \# P$   
**by** (*metis assms lens-equiv-def sublens-pres-mwb sublens-put-put unrest-uexpr.rep-eq*)

If we can show that an expression is unrestricted on a bijective lens, then is unrestricted on the entire state-space.

**lemma** *bij-lens-unrest-all*:

**fixes**  $P :: ('a, 'α) \text{ uexpr}$   
**assumes**  $\text{bij-lens } X \ X \ \# P$   
**shows**  $\Sigma \ \# P$   
**using** *assms bij-lens-equiv-id lens-equiv-def unrest-sublens* **by** *blast*

**lemma** *bij-lens-unrest-all-eq*:

**fixes**  $P :: ('a, 'α) \text{ uexpr}$   
**assumes**  $\text{bij-lens } X$   
**shows**  $(\Sigma \ \# P) \longleftrightarrow (X \ \# P)$

by (meson assms bij-lens-equiv-id lens-equiv-def unrest-sublens)

If an expression is unrestricted by all variables, then it is unrestricted by any variable

**lemma** *unrest-all-var*:  
 fixes  $e :: ('a, 'α) uexpr$   
 assumes  $\Sigma \# e$   
 shows  $x \# e$   
 by (metis assms id-lens-def lens.simps(2) unrest-uexpr.rep-eq)

We can split an unrestricted composed by lens plus

**lemma** *unrest-plus-split*:  
 fixes  $P :: ('a, 'α) uexpr$   
 assumes  $x \bowtie y$  *vwb-lens*  $x$  *vwb-lens*  $y$   
 shows  $\text{unrest } (x +_L y) P \longleftrightarrow (x \# P) \wedge (y \# P)$   
 using *assms*  
 by (meson lens-plus-right-sublens lens-plus-ub sublens-refl unrest-sublens unrest-var-comp vwb-lens-wb)

The following laws demonstrate the primary motivation for lens independence: a variable expression is unrestricted by another variable only when the two variables are independent. Lens independence thus effectively allows us to semantically characterise when two variables, or sets of variables, are different.

**lemma** *unrest-var* [*unrest*]:  $\llbracket \text{mwb-lens } x; x \bowtie y \rrbracket \Longrightarrow y \# \text{var } x$   
 by (transfer, auto)

**lemma** *unrest-iuvar* [*unrest*]:  $\llbracket \text{mwb-lens } x; x \bowtie y \rrbracket \Longrightarrow \$y \# \$x$   
 by (simp add: unrest-var)

**lemma** *unrest-ouvar* [*unrest*]:  $\llbracket \text{mwb-lens } x; x \bowtie y \rrbracket \Longrightarrow \$y' \# \$x'$   
 by (simp add: unrest-var)

The following laws follow automatically from independence of input and output variables.

**lemma** *unrest-iuvar-ouvar* [*unrest*]:  
 fixes  $x :: ('a \Longrightarrow 'α)$   
 assumes *mwb-lens*  $y$   
 shows  $\$x \# \$y'$   
 by (metis prod.collapse unrest-uexpr.rep-eq var.rep-eq var-lookup-out var-update-in)

**lemma** *unrest-ouvar-iuvar* [*unrest*]:  
 fixes  $x :: ('a \Longrightarrow 'α)$   
 assumes *mwb-lens*  $y$   
 shows  $\$x' \# \$y$   
 by (metis prod.collapse unrest-uexpr.rep-eq var.rep-eq var-lookup-in var-update-out)

Unrestriction distributes through the various function lifting expression constructs; this allows us to prove unrestrictedions for the majority of the expression language.

**lemma** *unrest-uop* [*unrest*]:  $x \# e \Longrightarrow x \# \text{uop } f e$   
 by (transfer, simp)

**lemma** *unrest-bop* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# \text{bop } f u v$   
 by (transfer, simp)

**lemma** *unrest-trop* [*unrest*]:  $\llbracket x \# u; x \# v; x \# w \rrbracket \Longrightarrow x \# \text{trop } f u v w$   
 by (transfer, simp)

**lemma** *unrest-qtop* [*unrest*]:  $\llbracket x \# u; x \# v; x \# w; x \# y \rrbracket \Longrightarrow x \# qtop\ f\ u\ v\ w\ y$   
**by** (*transfer*, *simp*)

For convenience, we also prove unrestriction rules for the bespoke operators on equality, numbers, arithmetic etc.

**lemma** *unrest-eq* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# u =_u v$   
**by** (*simp add: eq-upred-def*, *transfer*, *simp*)

**lemma** *unrest-zero* [*unrest*]:  $x \# 0$   
**by** (*simp add: unrest-lit zero-uexpr-def*)

**lemma** *unrest-one* [*unrest*]:  $x \# 1$   
**by** (*simp add: one-uexpr-def unrest-lit*)

**lemma** *unrest-numeral* [*unrest*]:  $x \# (\text{numeral } n)$   
**by** (*simp add: numeral-uexpr-simp unrest-lit*)

**lemma** *unrest-sgn* [*unrest*]:  $x \# u \Longrightarrow x \# \text{sgn } u$   
**by** (*simp add: sgn-uexpr-def unrest-uop*)

**lemma** *unrest-abs* [*unrest*]:  $x \# u \Longrightarrow x \# \text{abs } u$   
**by** (*simp add: abs-uexpr-def unrest-uop*)

**lemma** *unrest-plus* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# u + v$   
**by** (*simp add: plus-uexpr-def unrest*)

**lemma** *unrest-uminus* [*unrest*]:  $x \# u \Longrightarrow x \# - u$   
**by** (*simp add: uminus-uexpr-def unrest*)

**lemma** *unrest-minus* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# u - v$   
**by** (*simp add: minus-uexpr-def unrest*)

**lemma** *unrest-times* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# u * v$   
**by** (*simp add: times-uexpr-def unrest*)

**lemma** *unrest-divide* [*unrest*]:  $\llbracket x \# u; x \# v \rrbracket \Longrightarrow x \# u / v$   
**by** (*simp add: divide-uexpr-def unrest*)

For a  $\lambda$ -term we need to show that the characteristic function expression does not restrict  $v$  for any input value  $x$ .

**lemma** *unrest-ulambda* [*unrest*]:  
 $\llbracket \bigwedge x. v \# F\ x \rrbracket \Longrightarrow v \# (\lambda x. F\ x)$   
**by** (*transfer*, *simp*)

**end**

## 5 Used-by

**theory** *utp-usedby*  
**imports** *utp-unrest*  
**begin**

The used-by predicate is the dual of unrestriction. It states that the given lens is an upper-bound on the size of state space the given expression depends on. It is similar to stating that

the lens is a valid alphabet for the predicate. For convenience, and because the predicate uses a similar form, we will reuse much of unrestriction's infrastructure.

## 6 Substitution

```

theory utp-subst
imports
  utp-expr
  utp-unrest
begin

```

### 6.1 Substitution definitions

Variable substitution, like unrestriction, will be characterised semantically using lenses and state-spaces. Effectively a substitution  $\sigma$  is simply a function on the state-space which can be applied to an expression  $e$  using the syntax  $\sigma \dagger e$ . We introduce a polymorphic constant that will be used to represent application of a substitution, and also a set of theorems to represent laws.

```

consts
  usubst :: 's  $\Rightarrow$  'a  $\Rightarrow$  'b (infixr  $\dagger$  80)

```

```

named-theorems usubst

```

A substitution is simply a transformation on the alphabet; it shows how variables should be mapped to different values. Most of the time these will be homogeneous functions but for flexibility we also allow some operations to be heterogeneous.

```

type-synonym (' $\alpha$ , ' $\beta$ ) psubst = ' $\alpha \Rightarrow$  ' $\beta$ 
type-synonym ' $\alpha$  usubst = ' $\alpha \Rightarrow$  ' $\alpha$ 

```

Application of a substitution simply applies the function  $\sigma$  to the state binding  $b$  before it is handed to  $e$  as an input. This effectively ensures all variables are updated in  $e$ .

```

lift-definition subst :: (' $\alpha$ , ' $\beta$ ) psubst  $\Rightarrow$  ('a, ' $\beta$ ) uexpr  $\Rightarrow$  ('a, ' $\alpha$ ) uexpr is
 $\lambda \sigma e b. e (\sigma b)$  .

```

```

adhoc-overloading

```

```

  usubst subst

```

Substitutions can be updated by associating variables with expressions. We thus create an additional polymorphic constant to represent updating the value of a variable to an expression in a substitution, where the variable is modelled by type ' $v$ '. This again allows us to support different notions of variables, such as deep variables, later.

```

consts subst-upd :: (' $\alpha$ , ' $\beta$ ) psubst  $\Rightarrow$  ' $v \Rightarrow$  ('a, ' $\alpha$ ) uexpr  $\Rightarrow$  (' $\alpha$ , ' $\beta$ ) psubst

```

The following function takes a substitution from state-space ' $\alpha$  to ' $\beta$ , a lens with source ' $\beta$  and view "'a", and an expression over ' $\alpha$  and returning a value of type "'a, and produces an updated substitution. It does this by constructing a substitution function that takes state binding  $b$ , and updates the state first by applying the original substitution  $\sigma$ , and then updating the part of the state associated with lens  $x$  with expression evaluated in the context of  $b$ . This effectively means that  $x$  is now associated with expression  $v$ . We add this definition to our overloaded constant.

```

definition subst-upd-uvar :: (' $\alpha$ , ' $\beta$ ) psubst  $\Rightarrow$  ('a  $\Rightarrow$  ' $\beta$ )  $\Rightarrow$  ('a, ' $\alpha$ ) uexpr  $\Rightarrow$  (' $\alpha$ , ' $\beta$ ) psubst where
  subst-upd-uvar  $\sigma x v = (\lambda b. put_x (\sigma b) ([v]_e b))$ 

```

```

adhoc-overloading

```

```

  subst-upd subst-upd-uvar

```

The next function looks up the expression associated with a variable in a substitution by use of the *get* lens function.

**lift-definition** *usubst-lookup* :: ( $'\alpha, '\beta$ ) *psubst*  $\Rightarrow$  ( $'a \Rightarrow '\beta$ )  $\Rightarrow$  ( $'a, '\alpha$ ) *ueexpr* ( $\langle \cdot \rangle_s$ )  
**is**  $\lambda \sigma x b. \text{get}_x (\sigma b)$  .

Substitutions also exhibit a natural notion of unrestriction which states that  $\sigma$  does not restrict  $x$  if application of  $\sigma$  to an arbitrary state  $\rho$  will not effect the valuation of  $x$ . Put another way, it requires that *put* and the substitution commute.

**definition** *unrest-usubst* :: ( $'a \Rightarrow '\alpha$ )  $\Rightarrow$   $'\alpha$  *usubst*  $\Rightarrow$  *bool*  
**where** *unrest-usubst*  $x \sigma = (\forall \rho v. \sigma (\text{put}_x \rho v) = \text{put}_x (\sigma \rho) v)$

### ad hoc-overloading

*unrest unrest-usubst*

A conditional substitution deterministically picks one of the two substitutions based on a Boolean expression which is evaluated on the present state-space. It is analogous to a functional if-then-else.

**definition** *cond-subst* ::  $'\alpha$  *usubst*  $\Rightarrow$  (*bool*,  $'\alpha$ ) *ueexpr*  $\Rightarrow$   $'\alpha$  *usubst*  $\Rightarrow$   $'\alpha$  *usubst* ( $((\exists \cdot \triangleleft \cdot \triangleright_s / \cdot) [52, 0, 53] 52)$  **where**  
*cond-subst*  $\sigma b \rho = (\lambda s. \text{if } \llbracket b \rrbracket_e s \text{ then } \sigma(s) \text{ else } \rho(s))$

Parallel substitutions allow us to divide the state space into three segments using two lens, A and B. They correspond to the part of the state that should be updated by the respective substitution. The two lenses should be independent. If any part of the state is not covered by either lenses then this area is left unchanged (framed).

**definition** *par-subst* ::  $'\alpha$  *usubst*  $\Rightarrow$  ( $'a \Rightarrow '\alpha$ )  $\Rightarrow$  ( $'b \Rightarrow '\alpha$ )  $\Rightarrow$   $'\alpha$  *usubst*  $\Rightarrow$   $'\alpha$  *usubst* **where**  
*par-subst*  $\sigma_1 A B \sigma_2 = (\lambda s. (s \oplus_L (\sigma_1 s) \text{ on } A) \oplus_L (\sigma_2 s) \text{ on } B)$

## 6.2 Syntax translations

We support two kinds of syntax for substitutions, one where we construct a substitution using a maplet-style syntax, with variables mapping to expressions. Such a constructed substitution can be applied to an expression. Alternatively, we support the more traditional notation,  $P\llbracket v/x \rrbracket$ , which also support multiple simultaneous substitutions. We have to use double square brackets as the single ones are already well used.

We set up non-terminals to represent a single substitution maplet, a sequence of maplets, a list of expressions, and a list of alphabets. The parser effectively uses *subst-upd* to construct substitutions from multiple variables.

**nonterminal** *smaplet and smaplets and uexprs and salphas*

### syntax

-*smaplet* :: [*salpha*,  $'a$ ]  $\Rightarrow$  *smaplet* ( $\cdot \mapsto_s \cdot$ )

 $\text{-psubst } m \text{ (-salphas } x \text{ } xs) \text{ (-ueprs } v \text{ } vs) \Rightarrow \text{-psubst } (\text{-psubst } m \text{ } x \text{ } v) \text{ } xs \text{ } vs$   
 $\text{-psubst } m \text{ } x \text{ } v \Rightarrow \text{CONST subst-upd } m \text{ } x \text{ } v$   
 $\text{-subst } P \text{ } v \text{ } x <= \text{CONST usubst } (\text{CONST subst-upd } (\text{CONST id}) \text{ } x \text{ } v) \text{ } P$   
 $\text{-subst } P \text{ } v \text{ } x <= \text{-subst } P \text{ } (\text{-spvar } x) \text{ } v$   
 $\text{-par-subst } \sigma_1 \text{ } A \text{ } B \text{ } \sigma_2 == \text{CONST par-subst } \sigma_1 \text{ } A \text{ } B \text{ } \sigma_2$

Thus we can write things like  $\sigma(x \mapsto_s v)$  to update a variable  $x$  in  $\sigma$  with expression  $v$ ,  $[x \mapsto_s e, y \mapsto_s f]$  to construct a substitution with two variables, and finally  $P[v/x]$ , the traditional syntax.

We can now express deletion of a substitution maplet.

**definition**  $\text{subst-del} :: 'a \text{ usubst} \Rightarrow ('a \Longrightarrow 'a) \Rightarrow 'a \text{ usubst}$  (**infix**  $-\text{s}$  85) **where**  
 $\text{subst-del } \sigma \text{ } x = \sigma(x \mapsto_s \&x)$

### 6.3 Substitution Application Laws

We set up a simple substitution tactic that applies substitution and unrestriction laws

**method**  $\text{subst-tac} = (\text{simp add: usubst unrest})?$

Evaluation of a substitution expression involves application of the substitution to different variables. Thus we first prove laws for these cases. The simplest substitution,  $\text{id}$ , when applied to any variable  $x$  simply returns the variable expression, since  $\text{id}$  has no effect.

**lemma**  $\text{usubst-lookup-id}$  [ $\text{usubst}$ ]:  $\langle \text{id} \rangle_s x = \text{var } x$   
**by** ( $\text{transfer}$ ,  $\text{simp}$ )

**lemma**  $\text{subst-upd-id-lam}$  [ $\text{usubst}$ ]:  $\text{subst-upd } (\lambda x. x) \text{ } x \text{ } v = \text{subst-upd id } x \text{ } v$   
**by** ( $\text{simp add: id-def}$ )

A substitution update naturally yields the given expression.

**lemma**  $\text{usubst-lookup-upd}$  [ $\text{usubst}$ ]:  
**assumes**  $\text{weak-lens } x$   
**shows**  $\langle \sigma(x \mapsto_s v) \rangle_s x = v$   
**using**  $\text{assms}$   
**by** ( $\text{simp add: subst-upd-uvar-def, transfer}$ ) ( $\text{simp}$ )

**lemma**  $\text{usubst-lookup-upd-pr-var}$  [ $\text{usubst}$ ]:  
**assumes**  $\text{weak-lens } x$   
**shows**  $\langle \sigma(x \mapsto_s v) \rangle_s (\text{pr-var } x) = v$   
**using**  $\text{assms}$   
**by** ( $\text{simp add: subst-upd-uvar-def pr-var-def, transfer}$ ) ( $\text{simp}$ )

Substitution update is idempotent.

**lemma**  $\text{usubst-upd-idem}$  [ $\text{usubst}$ ]:  
**assumes**  $\text{mwb-lens } x$   
**shows**  $\sigma(x \mapsto_s u, x \mapsto_s v) = \sigma(x \mapsto_s v)$

by (simp add: subst-upd-uvar-def assms comp-def)

Substitution updates commute when the lenses are independent.

**lemma** *usubst-upd-comm*:

**assumes**  $x \bowtie y$

**shows**  $\sigma(x \mapsto_s u, y \mapsto_s v) = \sigma(y \mapsto_s v, x \mapsto_s u)$

**using** *assms*

**by** (rule-tac ext, auto simp add: subst-upd-uvar-def assms comp-def lens-indep-comm)

**using** *assms*  
**by** (*simp add: subst-upd-uvar-def, transfer, auto, metis (no-types, hide-lams) lens-indep-comm*)

**lemma** *subst-compose-upd* [*usubst*]:  $x \# \sigma \implies \sigma \circ \varrho(x \mapsto_s v) = (\sigma \circ \varrho)(x \mapsto_s v)$   
**by** (*simp add: subst-upd-uvar-def, transfer, auto simp add: unrest-usubst-def*)

Any substitution is a monotonic function.

**lemma** *subst-mono: mono (subst σ)*  
**by** (*simp add: less-eq-uexpr.rep-eq mono-def subst.rep-eq*)

## 6.4 Substitution laws

We now prove the key laws that show how a substitution should be performed for every expression operator, including the core function operators, literals, variables, and the arithmetic operators. They are all added to the *usubst* theorem attribute so that we can apply them using the substitution tactic.

**lemma** *id-subst* [*usubst*]:  $id \dagger v = v$   
**by** (*transfer, simp*)

**lemma** *subst-lit* [*usubst*]:  $\sigma \dagger \langle\!\langle v \rangle\!\rangle = \langle\!\langle v \rangle\!\rangle$   
**by** (*transfer, simp*)

**lemma** *subst-var* [*usubst*]:  $\sigma \dagger \text{var } x = \langle\sigma\rangle_s x$   
**by** (*transfer, simp*)

**lemma** *usubst-ulambda* [*usubst*]:  $\sigma \dagger (\lambda x \cdot P(x)) = (\lambda x \cdot \sigma \dagger P(x))$   
**by** (*transfer, simp*)

**lemma** *unrest-usubst-del* [*unrest*]:  $\llbracket \text{vwb-lens } x; x \# (\langle\sigma\rangle_s x); x \# \sigma -_s x \rrbracket \implies x \# (\sigma \dagger P)$   
**by** (*simp add: subst-del-def subst-upd-uvar-def unrest-uexpr-def unrest-usubst-def subst.rep-eq usubst-lookup.rep-eq (metis vwb-lens.put-eq)*)

We add the symmetric definition of input and output variables to substitution laws so that the variables are correctly normalised after substitution.

**lemma** *subst-uop* [*usubst*]:  $\sigma \dagger uop f v = uop f (\sigma \dagger v)$   
**by** (*transfer, simp*)

**lemma** *subst-bop* [*usubst*]:  $\sigma \dagger bop f u v = bop f (\sigma \dagger u) (\sigma \dagger v)$   
**by** (*transfer, simp*)

**lemma** *subst-trop* [*usubst*]:  $\sigma \dagger \text{trop } f \ u \ v \ w = \text{trop } f \ (\sigma \dagger u) \ (\sigma \dagger v) \ (\sigma \dagger w)$   
**by** (*transfer*, *simp*)

**lemma** *subst-qtop* [*usubst*]:  $\sigma \dagger \text{qtop } f \ u \ v \ w \ x = \text{qtop } f \ (\sigma \dagger u) \ (\sigma \dagger v) \ (\sigma \dagger w) \ (\sigma \dagger x)$   
**by** (*transfer*, *simp*)

**lemma** *subst-case-prod* [*usubst*]:  
**fixes**  $P :: 'i \Rightarrow 'j \Rightarrow ('a, 'a) \text{ uexpr}$   
**shows**  $\sigma \dagger \text{case-prod } (\lambda x \ y. P \ x \ y) \ v = \text{case-prod } (\lambda x \ y. \sigma \dagger P \ x \ y) \ v$   
**by** (*simp add: case-prod-beta'*)

**lemma** *subst-plus* [*usubst*]:  $\sigma \dagger (x + y) = \sigma \dagger x + \sigma \dagger y$   
**by** (*simp add: plus-uexpr-def subst-bop*)

**lemma** *subst-times* [*usubst*]:  $\sigma \dagger (x * y) = \sigma \dagger x * \sigma \dagger y$   
**by** (*simp add: times-uexpr-def subst-bop*)

**lemma** *subst-mod* [*usubst*]:  $\sigma \dagger (x \text{ mod } y) = \sigma \dagger x \text{ mod } \sigma \dagger y$   
**by** (*simp add: mod-uexpr-def usubst*)

**lemma** *subst-div* [*usubst*]:  $\sigma \dagger (x \text{ div } y) = \sigma \dagger x \text{ div } \sigma \dagger y$   
**by** (*simp add: divide-uexpr-def usubst*)

**lemma** *subst-minus* [*usubst*]:  $\sigma \dagger (x - y) = \sigma \dagger x - \sigma \dagger y$   
**by** (*simp add: minus-uexpr-def subst-bop*)

**lemma** *subst-uminus* [*usubst*]:  $\sigma \dagger (- x) = - (\sigma \dagger x)$   
**by** (*simp add: uminus-uexpr-def subst-uop*)

**lemma** *usubst-sgn* [*usubst*]:  $\sigma \dagger \text{sgn } x = \text{sgn } (\sigma \dagger x)$   
**by** (*simp add: sgn-uexpr-def subst-uop*)

**lemma** *usubst-abs* [*usubst*]:  $\sigma \dagger \text{abs } x = \text{abs } (\sigma \dagger x)$   
**by** (*simp add: abs-uexpr-def subst-uop*)

**lemma** *subst-zero* [*usubst*]:  $\sigma \dagger 0 = 0$   
**by** (*simp add: zero-uexpr-def subst-lit*)

**lemma** *subst-one* [*usubst*]:  $\sigma \dagger 1 = 1$   
**by** (*simp add: one-uexpr-def subst-lit*)

**lemma** *subst-eq-upred* [*usubst*]:  $\sigma \dagger (x =_u y) = (\sigma \dagger x =_u \sigma \dagger y)$   
**by** (*simp add: eq-upred-def usubst*)

This laws shows the effect of applying one substitution after another – we simply use function composition to compose them.

**lemma** *subst-subst* [*usubst*]:  $\sigma \dagger \varrho \dagger e = (\varrho \circ \sigma) \dagger e$   
**by** (*transfer*, *simp*)

The next law is similar, but shows how such a substitution is to be applied to every updated variable additionally.

**lemma** *subst-upd-comp* [*usubst*]:  
**fixes**  $x :: ('a \Rightarrow 'a)$   
**shows**  $\varrho(x \mapsto_s v) \circ \sigma = (\varrho \circ \sigma)(x \mapsto_s \sigma \dagger v)$   
**by** (*rule ext*, *simp add: uexpr-defs subst-upd-uvar-def*, *transfer*, *simp*)

```

lemma subst-singleton:
  fixes  $x :: ('a \Rightarrow 'α)$ 
  assumes  $x \# \sigma$ 
  shows  $\sigma(x \mapsto_s v) \uparrow P = (\sigma \uparrow P)[v/x]$ 
  using assms
  by (simp add: usubst)

```

```

lemmas subst-to-singleton = subst-singleton id-subst

```

## 6.5 Ordering substitutions

We set up a purely syntactic order on variable lenses which is useful for the substitution normal form.

```

definition var-name-ord :: ('a  $\Rightarrow$  'α)  $\Rightarrow$  ('b  $\Rightarrow$  'α)  $\Rightarrow$  bool where
  [no-atp]: var-name-ord  $x\ y = \text{True}$ 

```

**syntax**

```

  -var-name-ord ::  $\text{salpha} \Rightarrow \text{salpha} \Rightarrow \text{bool}$  (infix  $\prec_v$  65)

```

**translations**

```

  -var-name-ord  $x\ y == \text{CONST } \text{var-name-ord } x\ y$ 

```

A fact of the form  $x \prec_v y$  has no logical information; it simply exists to define a total order on named lenses that is useful for normalisation. The following theorem is simply an instance of the commutativity law for substitutions. However, that law could not be a simplification law as it would cause the simplifier to loop. Assuming that the variable order is a total order then this theorem will not loop.

```

lemma usubst-upd-comm-ord [usubst]:
  assumes  $x \bowtie y\ y \prec_v x$ 
  shows  $\sigma(x \mapsto_s u, y \mapsto_s v) = \sigma(y \mapsto_s v, x \mapsto_s u)$ 
  by (simp add: assms(1) usubst-upd-comm)

```

```

lemma var-name-order-comp-outer [usubst]:  $x \prec_v y \Longrightarrow x:a \prec_v y:b$ 
  by (simp add: var-name-ord-def)

```

```

lemma var-name-ord-comp-inner [usubst]:  $a \prec_v b \Longrightarrow x:a \prec_v x:b$ 
  by (simp add: var-name-ord-def)

```

```

lemma var-name-ord-pr-var-1 [usubst]:  $x \prec_v y \Longrightarrow \&x \prec_v y$ 
  by (simp add: var-name-ord-def)

```

```

lemma var-name-ord-pr-var-2 [usubst]:  $x \prec_v y \Longrightarrow x \prec_v \&y$ 
  by (simp add: var-name-ord-def)

```

## 6.6 Unrestriction laws

These are the key unrestricted theorems for substitutions and expressions involving substitutions.

```

lemma unrest-usubst-single [unrest]:
   $\llbracket \text{mwb-lens } x; x \# v \rrbracket \Longrightarrow x \# P[v/x]$ 
  by (transfer, auto simp add: subst-upd-uvar-def unrest-ueexpr-def)

```

**lemma** *unrest-usubst-id* [*unrest*]:  
 $mwb\text{-}lens\ x \implies x \# id$   
**by** (*simp add: unrest-usubst-def*)

**lemma** *unrest-usubst-upd* [*unrest*]:  
 $\llbracket x \bowtie y; x \# \sigma; x \# v \rrbracket \implies x \# \sigma(y \mapsto_s v)$   
**by** (*simp add: subst-upd-uvar-def unrest-usubst-def unrest-uepr.rep-eq lens-indep-comm*)

**lemma** *unrest-subst* [*unrest*]:  
 $\llbracket x \# P; x \# \sigma \rrbracket \implies x \# (\sigma \dagger P)$   
**by** (*transfer, simp add: unrest-usubst-def*)

## 6.7 Conditional Substitution Laws

**lemma** *usubst-cond-upd-1* [*usubst*]:  
 $\sigma(x \mapsto_s u) \triangleleft b \triangleright_s \varrho(x \mapsto_s v) = (\sigma \triangleleft b \triangleright_s \varrho)(x \mapsto_s u \triangleleft b \triangleright v)$   
**by** (*simp add: cond-subst-def subst-upd-uvar-def, transfer, auto*)

**lemma** *usubst-cond-upd-2* [*usubst*]:  
 $\llbracket vwb\text{-}lens\ x; x \# \varrho \rrbracket \implies \sigma(x \mapsto_s u) \triangleleft b \triangleright_s \varrho = (\sigma \triangleleft b \triangleright_s \varrho)(x \mapsto_s u \triangleleft b \triangleright \&x)$   
**by** (*simp add: cond-subst-def subst-upd-uvar-def unrest-usubst-def, transfer*)  
*(metis (full-types, hide-lams) id-apply pr-var-def subst-upd-uvar-def usubst-upd-pr-var-id var.rep-eq)*

**lemma** *usubst-cond-upd-3* [*usubst*]:

**end**

## 7 UTP Tactics

```
theory utp-tactics
imports
  utp-expr utp-unrest utp-usedby
keywords update-ueexpr-rep-eq-thms :: thy-decl
begin
```

In this theory, we define several automatic proof tactics that use transfer techniques to re-interpret proof goals about UTP predicates and relations in terms of pure HOL conjectures. The fundamental tactics to achieve this are *pred-simp* and *rel-simp*; a more detailed explanation of their behaviour is given below. The tactics can be given optional arguments to fine-tune their behaviour. By default, they use a weaker but faster form of transfer using rewriting; the option *robust*, however, forces them to use the slower but more powerful transfer of Isabelle's lifting package. A second option *no-interp* suppresses the re-interpretation of state spaces in order to eradicate record for tuple types prior to automatic proof.

In addition to *pred-simp* and *rel-simp*, we also provide the tactics *pred-auto* and *rel-auto*, as well as *pred-blast* and *rel-blast*; they, in essence, sequence the simplification tactics with the methods *auto* and *blast*, respectively.

### 7.1 Theorem Attributes

The following named attributes have to be introduced already here since our tactics must be able to see them. Note that we do not want to import the theories *utp-pred* and *utp-rel* here, so that both can potentially already make use of the tactics we define in this theory.

```
named-theorems upred-defs upred definitional theorems
named-theorems urel-defs urel definitional theorems
```

### 7.2 Generic Methods

We set up several automatic tactics that recast theorems on UTP predicates into equivalent HOL predicates, eliminating artefacts of the mechanisation as much as this is possible. Our approach is first to unfold all relevant definition of the UTP predicate model, then perform a transfer, and finally simplify by using lens and variable definitions, the split laws of alphabet records, and interpretation laws to convert record-based state spaces into products. The definition of the respective methods is facilitated by the Eisbach tool: we define generic methods that are parametrised by the tactics used for transfer, interpretation and subsequent automatic proof. Note that the tactics only apply to the head goal.

#### Generic Predicate Tactics

```
method gen-pred-tac methods transfer-tac interp-tac prove-tac = (
  ((unfold upred-defs) [1])?;
  (transfer-tac),
  (simp add: fun-eq-iff
    lens-defs upred-defs alpha-splits Product-Type.split-beta)?,
  (interp-tac)?);
(prove-tac)
```

#### Generic Relational Tactics

```
method gen-rel-tac methods transfer-tac interp-tac prove-tac = (
  ((unfold upred-defs urel-defs) [1])?;
```

```

(transfer-tac),
(simp add: fun-eq-iff relcomp-unfold OO-def
 lens-defs upred-defs alpha-splits Product-Type.split-beta)?,
(interp-tac)?);
(prove-tac)

```

### 7.3 Transfer Tactics

Next, we define the component tactics used for transfer.

#### 7.3.1 Robust Transfer

Robust transfer uses the transfer method of the lifting package.

```
method slow-uexpr-transfer = (transfer)
```

#### 7.3.2 Faster Transfer

Fast transfer side-steps the use of the (*transfer*) method in favour of plain rewriting with the underlying *rep-eq...* laws of lifted definitions. For moderately complex terms, surprisingly, the transfer step turned out to be a bottle-neck in some proofs; we observed that faster transfer resulted in a speed-up of approximately 30% when building the UTP theory heaps. On the downside, tactics using faster transfer do not always work but merely in about 95% of the cases. The approach typically works well when proving predicate equalities and refinements conjectures.

A known limitation is that the faster tactic, unlike lifting transfer, does not turn free variables into meta-quantified ones. This can, in some cases, interfere with the interpretation step and cause subsequent application of automatic proof tactics to fail. A fix is in progress [TODO].

**Attribute Setup** We first configure a dynamic attribute *uexpr-rep-eq-thms* to automatically collect all *rep-eq*-laws of lifted definitions on the *uexpr* type.

**ML-file** *uexpr-rep-eq.ML*

```

setup <<
  Global-Theory.add-thms-dynamic (@{binding uexpr-rep-eq-thms},
    uexpr-rep-eq.get-uexpr-rep-eq-thms o Context.theory-of)
>>

```

We next configure a command **update-uexpr-rep-eq-thms** in order to update the content of the *uexpr-rep-eq-thms* attribute. Although the relevant theorems are collected automatically, for efficiency reasons, the user has to manually trigger the update process. The command must hence be executed whenever new lifted definitions for type *uexpr* are created. The updating mechanism uses **find-theorems** under the hood.

```

ML <<
  Outer-Syntax.command @{command-keyword update-uexpr-rep-eq-thms}
    reread and update content of the uexpr-rep-eq-thms attribute
    (Scan.succeed (Toplevel.theory uexpr-rep-eq.read-uexpr-rep-eq-thms));
>>

```

**update-uexpr-rep-eq-thms** — Read *uexpr-rep-eq-thms* here.

Lastly, we require several named-theorem attributes to record the manual transfer laws and extra simplifications, so that the user can dynamically extend them in child theories.

**named-theorems** *ueexpr-transfer-laws ueexpr transfer laws*

**declare** *ueexpr-eq-iff* [*ueexpr-transfer-laws*]

**named-theorems** *ueexpr-transfer-extra extra simplifications for ueexpr transfer*

**declare** *unrest-ueexpr.rep-eq* [*ueexpr-transfer-extra*]

*usedBy-ueexpr.rep-eq* [*ueexpr-transfer-extra*]

*utp-expr.numeral-ueexpr.rep-eq* [*ueexpr-transfer-extra*]

*utp-expr.less-eq-ueexpr.rep-eq* [*ueexpr-transfer-extra*]

*Abs-ueexpr-inverse* [*simplified, ueexpr-transfer-extra*]

*Rep-ueexpr-inverse* [*ueexpr-transfer-extra*]

**Tactic Definition** We have all ingredients now to define the fast transfer tactic as a single simplification step.

**method** *fast-ueexpr-transfer* =

(*simp add: ueexpr-transfer-laws ueexpr-rep-eq-thms ueexpr-transfer-extra*)

## 7.4 Interpretation

The interpretation of record state spaces as products is done using the laws provided by the utility theory *Interp*. Note that this step can be suppressed by using the *no-interp* option.

**method** *ueexpr-interp-tac* = (*simp add: lens-interp-laws*)?

## 7.5 User Tactics

In this section, we finally set-up the six user tactics: *pred-simp*, *rel-simp*, *pred-auto*, *rel-auto*, *pred-blast* and *rel-blast*. For this, we first define the proof strategies that are to be applied *after* the transfer steps.

**method** *utp-simp-tac* = (*clarsimp*)?

**method** *utp-auto-tac* = ((*clarsimp*)?; *auto*)

**method** *utp-blast-tac* = ((*clarsimp*)?; *blast*)

The ML file below provides ML constructor functions for tactics that process arguments suitable and invoke the generic methods *gen-pred-tac* and *gen-rel-tac* with suitable arguments.

**ML-file** *utp-tactics.ML*

Finally, we execute the relevant outer commands for method setup. Sadly, this cannot be done at the level of Eisbach since the latter does not provide a convenient mechanism to process symbolic flags as arguments. It may be worth to put in a feature request with the developers of the Eisbach tool.

```
method-setup pred-simp = <<
  (Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-simp-tac in
      (UTP-Tactics.inst-gen-pred-tac args prove-tac ctx)
    end);
  >>
```

```
method-setup rel-simp = <<
```

```

(Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-simp-tac in
    (UTP-Tactics.inst-gen-rel-tac args prove-tac ctx)
  end);
>>

method-setup pred-auto = <<
  (Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-auto-tac in
    (UTP-Tactics.inst-gen-pred-tac args prove-tac ctx)
  end);
>>

method-setup rel-auto = <<
  (Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-auto-tac in
    (UTP-Tactics.inst-gen-rel-tac args prove-tac ctx)
  end);
>>

method-setup pred-blast = <<
  (Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-blast-tac in
    (UTP-Tactics.inst-gen-pred-tac args prove-tac ctx)
  end);
>>

method-setup rel-blast = <<
  (Scan.lift UTP-Tactics.scan-args) >>
  (fn args => fn ctx =>
    let val prove-tac = Basic-Tactics.utp-blast-tac in
    (UTP-Tactics.inst-gen-rel-tac args prove-tac ctx)
  end);
>>

```

Simpler, one-shot versions of the above tactics, but without the possibility of dynamic arguments.

```

method rel-simp'
  uses simp
  = (simp add: upred-defs urel-defs lens-defs prod.case-eq-if relcomp-unfold uexpr-transfer-laws uexpr-transfer-extra
    uexpr-rep-eq-thms simp)

method rel-auto'
  uses simp intro elim dest
  = (auto intro: intro elim: elim dest: dest simp add: upred-defs urel-defs lens-defs relcomp-unfold
    uexpr-transfer-laws uexpr-transfer-extra uexpr-rep-eq-thms simp)

method rel-blast'
  uses simp intro elim dest
  = (rel-simp' simp: simp, blast intro: intro elim: elim dest: dest)

```

end

## 8 Meta-level substitution

```
theory utp-meta-subst
imports utp-subst utp-tactics
begin
```

Meta substitution substituted a HOL variable in a UTP expression for another UTP expression. It is analogous to UTP substitution, but acts on functions.

**lift-definition**  $msubst :: ('b \Rightarrow ('a, 'a) uexpr) \Rightarrow ('b, 'a) uexpr \Rightarrow ('a, 'a) uexpr$

## 9 Alphabetised Predicates

```

theory utp-pred
imports
  utp-expr
  utp-subst
  utp-meta-subst
  utp-tactics
begin

```

In this theory we begin to create an Isabelle version of the alphabetised predicate calculus that is described in Chapter 1 of the UTP book [5].

### 9.1 Predicate type and syntax

An alphabetised predicate is simply a boolean valued expression.

```

type-synonym 'α upred = (bool, 'α) uexpr

```

```

translations
  (type) 'α upred <= (type) (bool, 'α) uexpr

```

We want to remain as close as possible to the mathematical UTP syntax, but also want to be conservative with HOL. For this reason we chose not to steal syntax from HOL, but where possible use polymorphism to allow selection of the appropriate operator (UTP vs. HOL). Thus we will first remove the standard syntax for conjunction, disjunction, and negation, and replace these with adhoc overloaded definitions. We similarly use polymorphic constants for the other predicate calculus operators.

```

purge-notation
  conj (infixr  $\wedge$  35) and
  disj (infixr  $\vee$  30) and
  Not ( $\neg$  - [40] 40)

consts
  uttrue :: 'a (true)
  ufalse :: 'a (false)
  uconj :: 'a  $\Rightarrow$  'a  $\Rightarrow$  'a (infixr  $\wedge$  35)
  udisj :: 'a  $\Rightarrow$  'a  $\Rightarrow$  'a (infixr  $\vee$  30)
  uimpl :: 'a  $\Rightarrow$  'a  $\Rightarrow$  'a (infixr  $\Rightarrow$  25)
  uiff :: 'a  $\Rightarrow$  'a  $\Rightarrow$  'a (infixr  $\Leftrightarrow$  25)
  unot :: 'a  $\Rightarrow$  'a ( $\neg$  - [40] 40)

```

$uex :: ('a \Rightarrow 'α) \Rightarrow 'p \Rightarrow 'p$   
 $uall :: ('a \Rightarrow 'α) \Rightarrow 'p \Rightarrow 'p$   
 $ushEx :: ['a \Rightarrow 'p] \Rightarrow 'p$   
 $ushAll :: ['a \Rightarrow 'p] \Rightarrow 'p$

#### ad hoc-overloading

$uconj$  *conj* **and**  
 $udisj$  *disj* **and**  
 $unot$  *Not*

We set up two versions of each of the quantifiers:  $uex$  /  $uall$  and  $ushEx$  /  $ushAll$ . The former pair allows quantification of UTP variables, whilst the latter allows quantification of HOL variables in concert with the literal expression constructor  $\ll x \gg$ . Both varieties will be needed at various points. Syntactically they are distinguished by a boldface quantifier for the HOL versions (achieved by the "bold" escape in Isabelle).

**nonterminal** *idt-list*

#### syntax

## 9.2 Predicate operators

We chose to maximally reuse definitions and laws built into HOL. For this reason, when introducing the core operators we proceed by lifting operators from the polymorphic algebraic hierarchy of HOL. Thus the initial definitions take place in the context of type class instantiations. We first introduce our own class called *refine* that will add the refinement operator syntax to the HOL partial order class.

**class** *refine* = *order*

**abbreviation** *refineBy* ::  $'a :: refine \Rightarrow 'a \Rightarrow bool$  (**infix**  $\sqsubseteq$  50) **where**

$P \sqsubseteq Q \equiv \text{less-eq } Q \ P$

Since, on the whole, lattices in UTP are the opposite way up to the standard definitions in HOL, we syntactically invert the lattice operators. This is the one exception where we do steal HOL syntax, but I think it makes sense for UTP. Indeed we make this inversion for all of the lattice operators.

**purge-notation** *Lattices.inf* (**infixl**  $\sqcap$  70)  
**notation** *Lattices.inf* (**infixl**  $\sqcup$  70)  
**purge-notation** *Lattices.sup* (**infixl**  $\sqcup$  65)  
**notation** *Lattices.sup* (**infixl**  $\sqcap$  65)

**purge-notation** *Inf* ( $\sqcap$  - [900] 900)  
**notation** *Inf* ( $\sqcup$  - [900] 900)  
**purge-notation** *Sup* ( $\sqcup$  - [900] 900)  
**notation** *Sup* ( $\sqcap$  - [900] 900)

**purge-notation** *Orderings.bot* ( $\perp$ )  
**notation** *Orderings.bot* ( $\top$ )  
**purge-notation** *Orderings.top* ( $\top$ )  
**notation** *Orderings.top* ( $\perp$ )

**purge-syntax**

-INF1 :: *pttrns*  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcap$  -./ -) [0, 10] 10)  
-Inf :: *pttrn*  $\Rightarrow$  'a set  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcap$  - $\in$  -./ -) [0, 0, 10] 10)  
-SUP1 :: *pttrns*  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcup$  -./ -) [0, 10] 10)  
-SUP :: *pttrn*  $\Rightarrow$  'a set  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcup$  - $\in$  -./ -) [0, 0, 10] 10)

**syntax**

-INF1 :: *pttrns*  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcup$  -./ -) [0, 10] 10)  
-Inf :: *pttrn*  $\Rightarrow$  'a set  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcup$  - $\in$  -./ -) [0, 0, 10] 10)  
-SUP1 :: *pttrns*  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcap$  -./ -) [0, 10] 10)  
-SUP :: *pttrn*  $\Rightarrow$  'a set  $\Rightarrow$  'b  $\Rightarrow$  'b (( $\exists \sqcap$  - $\in$  -./ -) [0, 0, 10] 10)

We trivially instantiate our refinement class

**instance** *uexpr* :: (*order*, *type*) *refine* ..

— Configure transfer law for refinement for the fast relational tactics.

**theorem** *upred-ref-iff* [*uexpr-transfer-laws*]:

$(P \sqsubseteq Q) = (\forall b. \llbracket Q \rrbracket_e b \longrightarrow \llbracket P \rrbracket_e b)$

**apply** (*transfer*)

**apply** (*clarsimp*)

**done**

Next we introduce the lattice operators, which is again done by lifting.

**instantiation** *uexpr* :: (*lattice*, *type*) *lattice*

**begin**

**lift-definition** *sup-uexpr* :: ('a, 'b) *uexpr*  $\Rightarrow$  ('a, 'b) *uexpr*  $\Rightarrow$  ('a, 'b) *uexpr*

**is**  $\lambda P \ Q \ A. \text{Lattices.sup } (P \ A) \ (Q \ A) .$

**lift-definition** *inf-uexpr* :: ('a, 'b) *uexpr*  $\Rightarrow$  ('a, 'b) *uexpr*  $\Rightarrow$  ('a, 'b) *uexpr*

**is**  $\lambda P \ Q \ A. \text{Lattices.inf } (P \ A) \ (Q \ A) .$

**instance**

**by** (*intro-classes*) (*transfer*, *auto*)+

**end**

```

instantiation uexpr :: (bounded-lattice, type) bounded-lattice
begin
  lift-definition bot-uexpr :: ('a, 'b) uexpr is  $\lambda A. \text{Orderings.bot}$  .
  lift-definition top-uexpr :: ('a, 'b) uexpr is  $\lambda A. \text{Orderings.top}$  .
instance
  by (intro-classes) (transfer, auto) +
end

```

```

lemma top-uexpr-rep-eq [simp]:
   $\llbracket \text{Orderings.bot} \rrbracket_e b = \text{False}$ 
  by (transfer, auto)

```

```

lemma bot-uexpr-rep-eq [simp]:
   $\llbracket \text{Orderings.top} \rrbracket_e b = \text{True}$ 
  by (transfer, auto)

```

```

instance uexpr :: (distrib-lattice, type) distrib-lattice
  by (intro-classes) (transfer, rule ext, auto simp add: sup-inf-distrib1)

```

Finally we show that predicates form a Boolean algebra (under the lattice operators), a complete lattice, a completely distribute lattice, and a complete boolean algebra. This equip us with a very complete theory for basic logical propositions.

```

instance uexpr :: (boolean-algebra, type) boolean-algebra
  apply (intro-classes, unfold uexpr-defs; transfer, rule ext)
  apply (simp-all add: sup-inf-distrib1 diff-eq)
  done

```

```

instantiation uexpr :: (complete-lattice, type) complete-lattice
begin
  lift-definition Inf-uexpr :: ('a, 'b) uexpr set  $\Rightarrow$  ('a, 'b) uexpr
  is  $\lambda PS A. \text{INF } P:PS. P(A)$  .
  lift-definition Sup-uexpr :: ('a, 'b) uexpr set  $\Rightarrow$  ('a, 'b) uexpr
  is  $\lambda PS A. \text{SUP } P:PS. P(A)$  .
instance
  by (intro-classes)
  (transfer, auto intro: INF-lower SUP-upper simp add: INF-greatest SUP-least) +
end

```

```

instance uexpr :: (complete-distrib-lattice, type) complete-distrib-lattice
  apply (intro-classes)
  apply (transfer, rule ext, auto)
  using sup-INF apply fastforce
  apply (transfer, rule ext, auto)
  using inf-SUP apply fastforce
  done

```

```

instance uexpr :: (complete-boolean-algebra, type) complete-boolean-algebra ..

```

From the complete lattice, we can also define and give syntax for the fixed-point operators. Like the lattice operators, these are reversed in UTP.

```

syntax
  -mu :: pttrn  $\Rightarrow$  logic  $\Rightarrow$  logic ( $\mu$  - · - [0, 10] 10)
  -nu :: pttrn  $\Rightarrow$  logic  $\Rightarrow$  logic ( $\nu$  - · - [0, 10] 10)

```

```

notation gfp ( $\mu$ )

```

**notation**  $lfp (\nu)$

**translations**

$$\begin{aligned}\nu X \cdot P &== \text{CONST } lfp (\lambda X. P) \\ \mu X \cdot P &== \text{CONST } gfp (\lambda X. P)\end{aligned}$$

With the lattice operators defined, we can proceed to give definitions for the standard predicate operators in terms of them.

**definition**  $true\text{-upred} = (\text{Orderings.top} :: 'a \text{ upred})$

**definition**  $false\text{-upred} = (\text{Orderings.bot} :: 'a \text{ upred})$

**definition**  $conj\text{-upred} = (\text{Lattices.inf} :: 'a \text{ upred} \Rightarrow 'a \text{ upred} \Rightarrow 'a \text{ upred})$

**definition**  $disj\text{-upred} = (\text{Lattices.sup} :: 'a \text{ upred} \Rightarrow 'a \text{ upred} \Rightarrow 'a \text{ upred})$

**definition**  $not\text{-upred} = (\text{uminus} :: 'a \text{ upred} \Rightarrow 'a \text{ upred})$

**definition**  $diff\text{-upred} = (\text{minus} :: 'a \text{ upred} \Rightarrow 'a \text{ upred} \Rightarrow 'a \text{ upred})$

**abbreviation**  $Conj\text{-upred} :: 'a \text{ upred set} \Rightarrow 'a \text{ upred } (\bigwedge - [900] 900) \text{ where}$   
 $\bigwedge A \equiv \bigcap A$

**abbreviation**  $Disj\text{-upred} :: 'a \text{ upred set} \Rightarrow 'a \text{ upred } (\bigvee - [900] 900) \text{ where}$   
 $\bigvee A \equiv \bigcup A$

**notation**

$conj\text{-upred}$  (**infixr**  $\wedge_p$  35) **and**  
 $disj\text{-upred}$  (**infixr**  $\vee_p$  30)

Perhaps slightly confusingly, the UTP infimum is the HOL supremum and vice-versa. This is because, again, in UTP the lattice is inverted due to the definition of refinement and a desire to have miracle at the top, and abort at the bottom.

**lift-definition**  $UINF :: ('a \Rightarrow 'a \text{ upred}) \Rightarrow ('a \Rightarrow ('b :: \text{complete-lattice}, 'a) \text{ uexpr}) \Rightarrow ('b, 'a) \text{ uexpr}$   
**is**  $\lambda P F b. \text{Sup } \{\llbracket F x \rrbracket_e b \mid x. \llbracket P x \rrbracket_e b\}.$

**lift-definition**  $USUP :: ('a \Rightarrow 'a \text{ upred}) \Rightarrow ('a \Rightarrow ('b :: \text{complete-lattice}, 'a) \text{ uexpr}) \Rightarrow ('b, 'a) \text{ uexpr}$   
**is**  $\lambda P F b. \text{Inf } \{\llbracket F x \rrbracket_e b \mid x. \llbracket P x \rrbracket_e b\}.$

**syntax**

$-USup \quad :: \text{pttrn} \Rightarrow \text{logic} \Rightarrow \text{logic} \quad (\bigwedge - \cdot - [0, 10] 10)$   
 $-USup \quad :: \text{pttrn} \Rightarrow \text{logic} \Rightarrow \text{logic} \quad (\bigcup - \cdot - [0, 10] 10)$   
 $-USup\text{-mem} :: \text{pttrn} \Rightarrow \text{logic} \Rightarrow \text{logic} \Rightarrow \text{logic} \quad (\bigwedge - \in \cdot \cdot - [0, 10] 10)$

```

by (pred-auto)+
end

```

## 10 UTP Events

```

theory utp-event
imports utp-pred
begin

```

### 10.1 Events

Events of some type  $'\vartheta$  are just the elements of that type.

```

type-synonym ' $\vartheta$  event = ' $\vartheta$ 

```

### 10.2 Channels

Typed channels are modelled as functions. Below,  $'a$  determines the channel type and  $'\vartheta$  the underlying event type. As with values, it is difficult to introduce channels as monomorphic types due to the fact that they can have arbitrary parametrisations in term of  $'a$ . Applying a channel to an element of its type yields an event, as we may expect. Though this is not formalised here, we may also sensibly assume that all channel- representing functions are injective. Note: is there benefit in formalising this here?

```

type-synonym ('a, ' $\vartheta$ ) chan = 'a  $\Rightarrow$  ' $\vartheta$  event

```

A downside of the approach is that the event type  $'\vartheta$  must be able to encode *all* events of a process model, and hence cannot be fixed upfront for a single channel or channel set. To do so, we actually require a notion of ‘extensible’ datatypes, in analogy to extensible record types. Another solution is to encode a notion of channel scoping that namely uses *sum* types to lift channel types into extensible ones, that is using channel-set specific scoping operators. This is a current work in progress.

#### 10.2.1 Operators

The Z type of a channel corresponds to the entire carrier of the underlying HOL type of that channel. Strictly, the function is redundant but was added to mirror the mathematical account in [?]. (TODO: Ask Simon Foster for [?])

**definition** *chan-type* :: ('a, ' $\vartheta$ ) chan  $\Rightarrow$  'a set ( $\delta_u$ ) **where**  
 $[upred-defs]: \delta_u c = UNIV$

The next lifted function creates an expression that yields a channel event, from an expression on the channel type  $'a$ .

**definition** *chan-apply* ::  
('a, ' $\vartheta$ ) chan  $\Rightarrow$  ('a, ' $\alpha$ ) uexpr  $\Rightarrow$  (' $\vartheta$  event, ' $\alpha$ ) uexpr ('(-/-')<sub>u</sub>) **where**  
 $[upred-defs]: (c \cdot e)_u = \ll c \gg (e)_a$

**lemma** *unrest-chan-apply* [unrest]:  $x \# e \Longrightarrow x \# (c \cdot e)_u$   
by (rel-auto)

**lemma** *usubst-chan-apply* [usubst]:  $\sigma \dagger (c \cdot v)_u = (c \cdot \sigma \dagger v)_u$   
by (rel-auto)

```

lemma msubst-event [usubst]:
   $(c \cdot v \ x)_u \llbracket x \rightarrow u \rrbracket = (c \cdot (v \ x) \llbracket x \rightarrow u \rrbracket)_u$ 
  by (pred-simp)

lemma msubst-event-2 [usubst]:
   $(c \cdot v \ x \ y)_u \llbracket (x, y) \rightarrow u \rrbracket = (c \cdot (v \ x \ y) \llbracket (x, y) \rightarrow u \rrbracket)_u$ 
  by (pred-simp) +

end

```

## 11 Alphabet Manipulation

```

theory utp-alphabet
  imports
    utp-pred utp-event
begin

```

### 11.1 Preliminaries

Alphabets are simply types that characterise the state-space of an expression. Thus the Isabelle type system ensures that predicates cannot refer to variables not in the alphabet as this would be a type error. Often one would like to add or remove additional variables, for example if we wish to have a predicate which ranges only a smaller state-space, and then lift it into a predicate over a larger one. This is useful, for example, when dealing with relations which refer only to undashed variables (conditions) since we can use the type system to ensure well-formedness.

In this theory we will set up operators for extending and contracting an alphabet. We first set up a theorem attribute for alphabet laws and a tactic.

```

named-theorems alpha

method alpha-tac = (simp add: alpha unrest)?

```

### 11.2 Alphabet Extrusion

Alter an alphabet by application of a lens that demonstrates how the smaller alphabet ( $\beta$ ) injects into the larger alphabet ( $\alpha$ ). This changes the type of the expression so it is parametrised over the large alphabet. We do this by using the lens *get* function to extract the smaller state binding, and then apply this to the expression.

We call this "extrusion" rather than "extension" because if the extension lens is bijective then it does not extend the alphabet. Nevertheless, it does have an effect because the type will be different which can be useful when converting predicates with equivalent alphabets.

**lift-definition** *aext* ::  $('a, 'b) \text{ uexpr} \Rightarrow ('b, 'a) \text{ lens} \Rightarrow ('a, 'a) \text{ uexpr}$  (**infixr**  $\oplus_p$  95)  
**is**  $\lambda P \ x \ b. P \ (\text{get}_x \ b)$  .

#### update-uexpr-rep-eq-thms

Next we prove some of the key laws. Extending an alphabet twice is equivalent to extending by the composition of the two lenses.

**lemma** *aext-twice*:  $(P \oplus_p a) \oplus_p b = P \oplus_p (a ;_L b)$   
**by** (*pred-auto*)

The bijective  $\Sigma$  lens identifies the source and view types. Thus an alphabet extension using this has no effect.

**lemma** *aext-id* [simp]:  $P \oplus_p 1_L = P$   
**by** (*pred-auto*)

Literals do not depend on any variables, and thus applying an alphabet extension only alters the predicate's type, and not its valuation .

**lemma** *aext-lit* [simp]:  $\ll v \gg \oplus_p a = \ll v \gg$   
**by** (*pred-auto*)

**lemma** *aext-zero* [simp]:  $0 \oplus_p a = 0$   
**by** (*pred-auto*)

**lemma** *aext-one* [simp]:  $1 \oplus_p a = 1$   
**by** (*pred-auto*)

**lemma** *aext-numeral* [simp]:  $\text{numeral } n \oplus_p a = \text{numeral } n$   
**by** (*pred-auto*)

**lemma** *aext-true* [simp]:  $\text{true} \oplus_p a = \text{true}$   
**by** (*pred-auto*)

**lemma** *aext-false* [simp]:  $\text{false} \oplus_p a = \text{false}$   
**by** (*pred-auto*)

**lemma** *aext-not* [alpha]:  $(\neg P) \oplus_p x = (\neg (P \oplus_p x))$   
**by** (*pred-auto*)

**lemma** *aext-and* [alpha]:  $(P \wedge Q) \oplus_p x = (P \oplus_p x \wedge Q \oplus_p x)$   
**by** (*pred-auto*)

**lemma** *aext-or* [alpha]:  $(P \vee Q) \oplus_p x = (P \oplus_p x \vee Q \oplus_p x)$   
**by** (*pred-auto*)

**lemma** *aext-imp* [alpha]:  $(P \Rightarrow Q) \oplus_p x = (P \oplus_p x \Rightarrow Q \oplus_p x)$   
**by** (*pred-auto*)

**lemma** *aext-iff* [alpha]:  $(P \Leftrightarrow Q) \oplus_p x = (P \oplus_p x \Leftrightarrow Q \oplus_p x)$   
**by** (*pred-auto*)

**lemma** *aext-shAll* [alpha]:  $(\forall x \cdot P(x)) \oplus_p a = (\forall x \cdot P(x) \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-event* [alpha]:  $(c \cdot v)_u \oplus_p a = (c \cdot v \oplus_p a)_u$   
**by** (*pred-auto*)

Alphabet extension distributes through the function liftings.

**lemma** *aext-uop* [alpha]:  $\text{uop } f \ u \oplus_p a = \text{uop } f \ (u \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-bop* [alpha]:  $\text{bop } f \ u \ v \oplus_p a = \text{bop } f \ (u \oplus_p a) \ (v \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-trop* [alpha]:  $\text{trop } f \ u \ v \ w \oplus_p a = \text{trop } f \ (u \oplus_p a) \ (v \oplus_p a) \ (w \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-qtop* [*alpha*]:  $qtop\ f\ u\ v\ w\ x\ \oplus_p\ a = qtop\ f\ (u\ \oplus_p\ a)\ (v\ \oplus_p\ a)\ (w\ \oplus_p\ a)\ (x\ \oplus_p\ a)$   
**by** (*pred-auto*)

**lemma** *aext-plus* [*alpha*]:  
 $(x + y) \oplus_p a = (x \oplus_p a) + (y \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-minus* [*alpha*]:  
 $(x - y) \oplus_p a = (x \oplus_p a) - (y \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-uminus* [*simp*]:  
 $(-x) \oplus_p a = -(x \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-times* [*alpha*]:  
 $(x * y) \oplus_p a = (x \oplus_p a) * (y \oplus_p a)$   
**by** (*pred-auto*)

**lemma** *aext-divide* [*alpha*]:  
 $(x / y) \oplus_p a = (x \oplus_p a) / (y \oplus_p a)$   
**by** (*pred-auto*)

Extending a variable expression over  $x$  is equivalent to composing  $x$  with the alphabet, thus effectively yielding a variable whose source is the large alphabet.

**lemma** *aext-var* [*alpha*]:  
 $var\ x\ \oplus_p\ a = var\ (x\ ;_L\ a)$   
**by** (*pred-auto*)

**lemma** *aext-ulambda* [*alpha*]:  $((\lambda x \cdot P(x)) \oplus_p a) = (\lambda x \cdot P(x) \oplus_p a)$   
**by** (*pred-auto*)

Alphabet extension is monotonic and continuous.

**lemma** *aext-mono*:  $P \sqsubseteq Q \implies P \oplus_p a \sqsubseteq Q \oplus_p a$   
**by** (*pred-auto*)

**lemma** *aext-cont* [*alpha*]:  $vw\!b\!-\!lens\ a \implies (\bigsqcap A) \oplus_p a = (\bigsqcap_{P \in A} P \oplus_p a)$   
**by** (*pred-simp*)

If a variable is unrestricted in a predicate, then the extended variable is unrestricted in the predicate with an alphabet extension.

**lemma** *unrest-aext* [*unrest*]:  
 $\llbracket\ mw\!b\!-\!lens\ a;\ x\ \sharp\ p\ \rrbracket \implies unrest\ (x\ ;_L\ a)\ (p \oplus_p a)$   
**by** (*transfer*, *simp add: lens-comp-def*)

If a given variable (or alphabet)  $b$  is independent of the extension lens  $a$ , that is, it is outside the original state-space of  $p$ , then it follows that once  $p$  is extended by  $a$  then  $b$  cannot be restricted.

**lemma** *unrest-aext-indep* [*unrest*]:  
 $a \bowtie b \implies b\ \sharp\ (p \oplus_p a)$   
**by** *pred-auto*

### 11.3 Expression Alphabet Restriction

Restrict an alphabet by application of a lens that demonstrates how the smaller alphabet ( $\beta$ ) injects into the larger alphabet ( $\alpha$ ). Unlike extension, this operation can lose information if the expressions refers to variables in the larger alphabet.

**lift-definition**  $arestr :: ('a, 'α) uexpr \Rightarrow ('β, 'α) lens \Rightarrow ('a, 'β) uexpr$  (**infixr**  $\vdash_e$  90)  
**is**  $\lambda P x b. P (create_x b)$ .

#### update-uexpr-rep-eq-thms

**lemma**  $arestr-id$  [simp]:  $P \vdash_e 1_L = P$   
**by** (*pred-auto*)

**lemma**  $arestr-aext$  [simp]:  $mwb-lens\ a \implies (P \oplus_p a) \vdash_e a = P$   
**by** (*pred-auto*)

If an expression's alphabet can be divided into two disjoint sections and the expression does not depend on the second half then restricting the expression to the first half is loss-less.

**lemma**  $aext-arestr$  [*alpha*]:  
**assumes**  $mwb-lens\ a\ bij-lens\ (a +_L b)\ a \bowtie b\ b \# P$   
**shows**  $(P \vdash_e a) \oplus_p a = P$   
**proof** –

**by** (*pred-auto*)

## 11.4 Predicate Alphabet Restriction

In order to restrict the variables of a predicate, we also need to existentially quantify away the other variables. We can't do this at the level of expressions, as quantifiers are not applicable here. Consequently, we need a specialised version of alphabet restriction for predicates. It both restricts the variables using quantification and then removes them from the alphabet type using expression restriction.

**definition** *upred-ares* ::  $'\alpha \text{ upred} \Rightarrow (' \beta \Longrightarrow ' \alpha) \Rightarrow ' \beta \text{ upred}$   
**where** [*upred-defs*]:  $\text{upred-ares } P \ a = (P \upharpoonright_v a) \upharpoonright_e a$

**syntax**

## 11.6 Substitution Alphabet Extension

This allows us to extend the alphabet of a substitution, in a similar way to expressions.

**definition** *subst-ext* ::  $'\alpha \text{ usubst} \Rightarrow ('\alpha \implies '\beta) \Rightarrow '\beta \text{ usubst}$  (**infix**  $\oplus_s$  65) **where**  
[*upred-defs*]:  $\sigma \oplus_s x = (\lambda s. \text{put}_x s (\sigma (\text{get}_x s)))$

**lemma** *id-subst-ext* [*usubst*]:  
*wb-lens*  $x \implies \text{id} \oplus_s x = \text{id}$   
**by** *pred-auto*

**lemma** *upd-subst-ext* [*alpha*]:  
*vwb-lens*  $x \implies \sigma(y \mapsto_s v) \oplus_s x = (\sigma \oplus_s x)(\&x:y \mapsto_s v \oplus_p x)$   
**by** *pred-auto*

**lemma** *apply-subst-ext* [*alpha*]:  
*vwb-lens*  $x \implies (\sigma \dagger e) \oplus_p x = (\sigma \oplus_s x) \dagger (e \oplus_p x)$   
**by** (*pred-auto*)

**lemma** *aext-upred-eq* [*alpha*]:  
 $((e =_u f) \oplus_p a) = ((e \oplus_p a) =_u (f \oplus_p a))$   
**by** (*pred-auto*)

**lemma** *subst-aext-comp* [*usubst*]:  
*vwb-lens*  $a \implies (\sigma \oplus_s a) \circ (\varrho \oplus_s a) = (\sigma \circ \varrho) \oplus_s a$   
**by** *pred-auto*

## 11.7 Substitution Alphabet Restriction

This allows us to reduce the alphabet of a substitution, in a similar way to expressions.

**definition** *subst-res* ::  $'\alpha \text{ usubst} \Rightarrow (' \beta \implies ' \alpha) \Rightarrow ' \beta \text{ usubst}$  (**infix**  $\upharpoonright_s$  65) **where**  
[*upred-defs*]:  $\sigma \upharpoonright_s x = (\lambda s. \text{get}_x (\sigma (\text{create}_x s)))$

**lemma** *id-subst-res* [*usubst*]:  
*mwb-lens*  $x \implies \text{id} \upharpoonright_s x = \text{id}$   
**by** *pred-auto*

**lemma** *upd-subst-res* [*alpha*]:  
*mwb-lens*  $x \implies \sigma(\&x:y \mapsto_s v) \upharpoonright_s x = (\sigma \upharpoonright_s x)(\&y \mapsto_s v \upharpoonright_e x)$   
**by** (*pred-auto*)

**lemma** *subst-ext-res* [*usubst*]:  
*mwb-lens*  $x \implies (\sigma \oplus_s x) \upharpoonright_s x = \sigma$

by (*pred-auto*)

**lemma** *unrest-subst-alpha-ext* [*unrest*]:  
 $x \bowtie y \implies x \sharp (P \oplus_s y)$   
 by (*pred-simp robust, metis lens-indep-def*)  
 end

## 12 Lifting expressions

**theory** *utp-lift*  
**imports**  
*utp-alphabet*  
**begin**

### 12.1 Lifting definitions

We define operators for converting an expression to and from a relational state space with the help of alphabet extrusion and restriction. In general throughout Isabelle/UTP we adopt the notation  $\lceil P \rceil$  with some subscript to denote lifting an expression into a larger alphabet, and  $\lfloor P \rfloor$  for dropping into a smaller alphabet.

The following two functions lift and drop an expression, respectively, whose alphabet is  $'\alpha$ , into a product alphabet  $'\alpha \times '\beta$ . This allows us to deal with expressions which refer only to undashed variables, and use the type-system to ensure this.

**abbreviation** *lift-pre* ::  $('a, '\alpha) \text{ uexpr} \Rightarrow ('a, '\alpha \times '\beta) \text{ uexpr}$  ( $\lceil \cdot \rceil_{<}$ )  
**where**  $\lceil P \rceil_{<} \equiv P \oplus_p \text{fst}_L$

**abbreviation** *drop-pre* ::  $('a, '\alpha \times '\beta) \text{ uexpr} \Rightarrow ('a, '\alpha) \text{ uexpr}$  ( $\lfloor \cdot \rfloor_{<}$ )  
**where**  $\lfloor P \rfloor_{<} \equiv P \upharpoonright_e \text{fst}_L$

The following two functions lift and drop an expression, respectively, whose alphabet is  $'\beta$ , into a product alphabet  $'\alpha \times '\beta$ . This allows us to deal with expressions which refer only to dashed variables.

**abbreviation** *lift-post* ::  $('a, '\beta) \text{ uexpr} \Rightarrow ('a, '\alpha \times '\beta) \text{ uexpr}$  ( $\lceil \cdot \rceil_{>}$ )  
**where**  $\lceil P \rceil_{>} \equiv P \oplus_p \text{snd}_L$

**abbreviation** *drop-post* ::  $('a, '\alpha \times '\beta) \text{ uexpr} \Rightarrow ('a, '\beta) \text{ uexpr}$  ( $\lfloor \cdot \rfloor_{>}$ )  
**where**  $\lfloor P \rfloor_{>} \equiv P \upharpoonright_e \text{snd}_L$

### 12.2 Lifting Laws

With the help of our alphabet laws, we can prove some intuitive laws about alphabet lifting. For example, lifting variables yields an unprimed or primed relational variable expression, respectively.

**lemma** *lift-pre-var* [*simp*]:  
 $\lceil \text{var } x \rceil_{<} = \$x$   
 by (*alpha-tac*)

**lemma** *lift-post-var* [*simp*]:  
 $\lceil \text{var } x \rceil_{>} = \$x'$   
 by (*alpha-tac*)

### 12.3 Substitution Laws

**lemma** *pre-var-subst* [*usubst*]:  
 $\sigma(\$x \mapsto_s \ll v \gg) \uparrow \lceil P \rceil_< = \sigma \uparrow \lceil P[\ll v \gg / \&x] \rceil_<$   
 by (*pred-simp*)

### 12.4 Unrestriction laws

Crucially, the lifting operators allow us to demonstrate unrestricted properties. For example, we can show that no primed variable is restricted in an expression over only the first element of the state-space product type.

**lemma** *unrest-dash-var-pre* [*unrest*]:  
 fixes  $x :: ('a \Rightarrow 'a)$   
 shows  $\$x' \# \lceil p \rceil_<$   
 by (*pred-auto*)

end

## 13 Predicate Calculus Laws

## 13.10 Refinement By Observation

Function to obtain the set of observations of a predicate

**definition** *obs-upred* ::  $'α \text{ upred} \Rightarrow 'α \text{ set } ([\![\cdot]\!]_o)$   
**where** *[upred-defs]*:  $\ll P \gg_o = \{b. \ll P \gg_e b\}$

**lemma** *obs-upred-refine-iff*:  
 $P \sqsubseteq Q \longleftrightarrow \ll Q \gg_o \subseteq \ll P \gg_o$   
 by (pred-auto)

A refinement can be demonstrated by considering only the observations of the predicates which are relevant, i.e. not unrestricted, for them. In other words, if the alphabet can be split into two disjoint segments,  $x$  and  $y$ , and neither predicate refers to  $y$  then only  $x$  need be considered when checking for observations.

**lemma** *refine-by-obs*:  
 assumes  $x \bowtie y \text{ bij-lens } (x +_L y) \ y \nmid P \ y \nmid Q \ \{v. 'P[\ll v \gg/x]\} \subseteq \{v. 'Q[\ll v \gg/x]\}$   
 shows  $Q \sqsubseteq P$   
 using *assms*(3-5)

**lemma** *UINF-healthy*:  $A \subseteq \llbracket H \rrbracket_H \implies (\bigcap P \in A \cdot F(P)) = (\bigcap P \in A \cdot F(H(P)))$   
**by** (*rule UINF-cong, simp add: Healthy-subset-member*)

**end**

## 15 Alphabetised Relations

**theory** *utp-rel*  
**imports**  
*utp-pred-laws*  
*utp-healthy*  
*utp-lift*  
*utp-tactics*  
**begin**

An alphabetised relation is simply a predicate whose state-space is a product type. In this theory we construct the core operators of the relational calculus, and prove a library of associated theorems, based on Chapters 2 and 5 of the UTP book [5].

## 15.1 Relational Alphabets

We set up convenient syntax to refer to the input and output parts of the alphabet, as is common in UTP. Since we are in a product space, these are simply the lenses  $fst_L$  and  $snd_L$ .

**definition**  $in\alpha :: ('\alpha \Rightarrow '\alpha \times '\beta)$  **where**  
 $[lens-defs]: in\alpha = fst_L$

**definition**  $out\alpha :: ('\beta \Rightarrow '\alpha \times '\beta)$  **where**  
 $[lens-defs]: out\alpha = snd_L$

**lemma**  $in\alpha\text{-uvar}$   $[simp]: vwb\text{-lens } in\alpha$   
**by**  $(unfold\text{-locales}, auto simp add: in\alpha\text{-def})$

**lemma**  $out\alpha\text{-uvar}$   $[simp]: vwb\text{-lens } out\alpha$   
**by**  $(unfold\text{-locales}, auto simp add: out\alpha\text{-def})$

**lemma**  $var\text{-in-alpha}$   $[simp]: x ;_L in\alpha = ivar\ x$   
**by**  $(simp add: fst\text{-lens-def } in\alpha\text{-def } in\text{-var-def})$

**lemma**  $var\text{-out-alpha}$   $[simp]: x ;_L out\alpha = ovar\ x$   
**by**  $(simp add: out\alpha\text{-def } out\text{-var-def } snd\text{-lens-def})$

**lemma**  $drop\text{-pre-inv}$   $[simp]: \llbracket out\alpha \# p \rrbracket \Longrightarrow \lceil [p]_{<} \rceil_{<} = p$   
**by**  $(pred\text{-simp})$

**lemma**  $usubst\text{-lookup-ivar-unrest}$   $[usubst]:$   
 $in\alpha \# \sigma \Longrightarrow \langle \sigma \rangle_s (ivar\ x) = \$x$   
**by**  $(rel\text{-simp}, metis\ fstI)$

**lemma**  $usubst\text{-lookup-ovar-unrest}$   $[usubst]:$   
 $out\alpha \# \sigma \Longrightarrow \langle \sigma \rangle_s (ovar\ x) = \$x'$   
**by**  $(rel\text{-simp}, metis\ sndI)$

**lemma**  $out\text{-alpha-in-indep}$   $[simp]:$   
 $out\alpha \bowtie in\text{-var } x\ in\text{-var } x \bowtie out\alpha$   
**by**  $(simp\text{-all add: } in\text{-var-def } out\alpha\text{-def } lens\text{-indep-def } fst\text{-lens-def } snd\text{-lens-def } lens\text{-comp-def})$

**lemma**  $in\text{-alpha-out-indep}$   $[simp]:$   
 $in\alpha \bowtie out\text{-var } x\ out\text{-var } x \bowtie in\alpha$   
**by**  $(simp\text{-all add: } in\text{-var-def } in\alpha\text{-def } lens\text{-indep-def } fst\text{-lens-def } lens\text{-comp-def})$

The following two functions lift a predicate substitution to a relational one.

**abbreviation**  $usubst\text{-rel-lift} :: '\alpha\ usubst \Rightarrow ('\alpha \times '\beta)\ usubst\ (\lceil - \rceil_s)$  **where**  
 $\lceil \sigma \rceil_s \equiv \sigma \oplus_s in\alpha$

**abbreviation**  $usubst\text{-rel-drop} :: ('\alpha \times '\alpha)\ usubst \Rightarrow '\alpha\ usubst\ (\lfloor - \rfloor_s)$  **where**  
 $\lfloor \sigma \rfloor_s \equiv \sigma \upharpoonright_s in\alpha$

The alphabet of a relation then consists wholly of the input and output portions.

**lemma**  $alpha\text{-in-out}$ :  
 $\Sigma \approx_L in\alpha +_L out\alpha$   
**by**  $(simp add: fst\text{-snd-id-lens } in\alpha\text{-def } lens\text{-equiv-refl } out\alpha\text{-def})$

## 15.2 Relational Types and Operators

We create type synonyms for conditions (which are simply predicates) – i.e. relations without dashed variables –, alphabetised relations where the input and output alphabet can be different, and finally homogeneous relations.

**type-synonym**  $'\alpha \text{ cond} = '\alpha \text{ upred}$   
**type-synonym**  $(''\alpha, '\beta) \text{ urel} = (''\alpha \times '\beta) \text{ upred}$   
**type-synonym**  $'\alpha \text{ hrel} = (''\alpha \times '\alpha) \text{ upred}$   
**type-synonym**  $('a, '\alpha) \text{ hexpr} = ('a, '\alpha \times '\alpha) \text{ uexpr}$

### translations

$(\text{type}) (''\alpha, '\beta) \text{ urel} \leq (\text{type}) (''\alpha \times '\beta) \text{ upred}$

We set up some overloaded constants for sequential composition and the identity in case we want to overload their definitions later.

### consts

$\text{useq} :: 'a \Rightarrow 'b \Rightarrow 'c \text{ (infixr ;; 71)}$   
 $\text{uassigns} :: 'a \text{ usubst} \Rightarrow 'b \text{ ((-)}_a)$   
 $\text{uskip} :: 'a \text{ (II)}$

We define a specialised version of the conditional where the condition can refer only to undashed variables, as is usually the case in programs, but not universally in UTP models. We implement this by lifting the condition predicate into the relational state-space with construction  $\lceil b \rceil_{<}$ .

**definition**  $\text{lift-rcond} (\lceil - \rceil_{<}) \text{ where}$

$[\text{upred-defs}]: \lceil b \rceil_{<} = \lceil b \rceil_{<}$

### abbreviation

$\text{rcond} :: (''\alpha, '\beta) \text{ urel} \Rightarrow '\alpha \text{ cond} \Rightarrow (''\alpha, '\beta) \text{ urel} \Rightarrow (''\alpha, '\beta) \text{ urel}$   
 $((\beta \triangleleft - \triangleright_r / -) [52, 0, 53] 52)$   
**where**  $(P \triangleleft b \triangleright_r Q) \equiv (P \triangleleft \lceil b \rceil_{<} \triangleright Q)$

Sequential composition is heterogeneous, and simply requires that the output alphabet of the first matches then input alphabet of the second. We define it by lifting HOL's built-in relational composition operator ( $op \ O$ ). Since this returns a set, the definition states that the state binding  $b$  is an element of this set.

**lift-definition**  $\text{seqr} :: (''\alpha, '\beta) \text{ urel} \Rightarrow (''\beta, '\gamma) \text{ urel} \Rightarrow (''\alpha \times '\gamma) \text{ upred}$   
**is**  $\lambda P Q b. b \in (\{p. P p\} O \{q. Q q\})$ .

### ad hoc-overloading

$\text{useq seqr}$

We also set up a homogeneous sequential composition operator, and versions of *true* and *false* that are explicitly typed by a homogeneous alphabet.

**abbreviation**  $\text{seqh} :: '\alpha \text{ hrel} \Rightarrow '\alpha \text{ hrel} \Rightarrow '\alpha \text{ hrel} \text{ (infixr ;;}_h \text{ 71) where}$   
 $\text{seqh } P Q \equiv (P ;; Q)$

**abbreviation**  $\text{truer} :: '\alpha \text{ hrel} (\text{true}_h) \text{ where}$

$\text{truer} \equiv \text{true}$

**abbreviation**  $\text{falser} :: '\alpha \text{ hrel} (\text{false}_h) \text{ where}$

$\text{falser} \equiv \text{false}$

We define the relational converse operator as an alphabet extrusion on the bijective lens  $\text{swap}_L$  that swaps the elements of the product state-space.

**abbreviation**  $conv-r :: ('a, 'α \times 'β) \text{ uepr} \Rightarrow ('a, 'β \times 'α) \text{ uepr} \text{ (- [999] 999)}$   
**where**  $conv-r \ e \equiv e \oplus_p \text{ swap}_L$

Assignment is defined using substitutions, where latter defines what each variable should map to. The definition of the operator identifies the after state binding,  $b'$ , with the substitution function applied to the before state binding  $b$ .

**lift-definition**  $assigns-r :: 'α \text{ usubst} \Rightarrow 'α \text{ hrel}$   
**is**  $\lambda \sigma \ (b, b'). \ b' = \sigma(b) \ .$

**ad hoc-overloading**  
 $uassigns \ assigns-r$

Relational identity, or skip, is then simply an assignment with the identity substitution: it simply identifies all variables.

**definition**  $skip-r :: 'α \text{ hrel}$  **where**  
 $[urel-defs]: \ skip-r = assigns-r \ id$

**ad hoc-overloading**  
 $uskip \ skip-r$

We set up iterated sequential composition which iterates an indexed predicate over the elements of a list.

**definition**  $seqr-iter :: 'a \text{ list} \Rightarrow ('a \Rightarrow 'b \text{ hrel}) \Rightarrow 'b \text{ hrel}$  **where**  
 $[urel-defs]: \ seqr-iter \ xs \ P = foldr \ (\lambda \ i \ Q. \ P(i) ;; Q) \ xs \ II$

A singleton assignment simply applies a singleton substitution function, and similarly for a double assignment.

**abbreviation**  $assign-r :: ('t \Longrightarrow 'α) \Rightarrow ('t, 'α) \text{ uepr} \Rightarrow 'α \text{ hrel}$   
**where**  $assign-r \ x \ v \equiv \langle [x \mapsto_s v] \rangle_a$

**abbreviation**  $assign-2-r ::$   
 $(t1 \Longrightarrow 'α) \Rightarrow (t2 \Longrightarrow 'α) \Rightarrow (t1, 'α) \text{ uepr} \Rightarrow (t2, 'α) \text{ uepr} \Rightarrow 'α \text{ hrel}$   
**where**  $assign-2-r \ x \ y \ u \ v \equiv assigns-r \ [x \mapsto_s u, y \mapsto_s v]$

We also define the alphabetised skip operator that identifies all input and output variables in the given alphabet lens. All other variables are unrestricted. We also set up syntax for it.

**definition**  $skip-ra :: ('β, 'α) \text{ lens} \Rightarrow 'α \text{ hrel}$  **where**  
 $[urel-defs]: \ skip-ra \ v = (\$v' =_u \$v)$

Similarly, we define the alphabetised assignment operator.

**definition**  $assigns-ra :: 'α \text{ usubst} \Rightarrow ('β, 'α) \text{ lens} \Rightarrow 'α \text{ hrel} \ (\langle - \rangle_-)$  **where**  
 $\langle \sigma \rangle_a = (\lceil \sigma \rceil_s \uparrow \ skip-ra \ a)$

Assumptions ( $c^\top$ ) and assertions ( $c_\perp$ ) are encoded as conditionals. An assumption behaves like skip if the condition is true, and otherwise behaves like *false* (miracle). An assertion is the same, but yields *true*, which is an abort.

**definition**  $rassume :: 'α \text{ upred} \Rightarrow 'α \text{ hrel} \ (\lceil - \rceil^\top)$  **where**  
 $[urel-defs]: \ rassume \ c = II \triangleleft c \triangleright_r \ false$

**definition**  $rassert :: 'α \text{ upred} \Rightarrow 'α \text{ hrel} \ (\{-\}_\perp)$  **where**  
 $[urel-defs]: \ rassert \ c = II \triangleleft c \triangleright_r \ true$

A test is like a precondition, except that it identifies to the postcondition, and is thus a refinement of  $II$ . It forms the basis for Kleene Algebra with Tests [7, 1] (KAT), which embeds a Boolean algebra into a Kleene algebra to represent conditions.

**definition** *lift-test*  $:: 'α \text{ cond} \Rightarrow 'α \text{ hrel } (\lceil \_ \rceil_t)$   
**where**  $[urel-defs]: \lceil b \rceil_t = (\lceil b \rceil_{<} \wedge II)$

We define two variants of while loops based on strongest and weakest fixed points. The former is *false* for an infinite loop, and the latter is *true*.

**definition** *while*  $:: 'α \text{ cond} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while^\top - do - od)$  **where**  
 $[urel-defs]: while^\top b \text{ do } P \text{ od} = (\nu X \cdot (P ;; X) \triangleleft b \triangleright_r II)$

**abbreviation** *while-top*  $:: 'α \text{ cond} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while - do - od)$  **where**  
 $while b \text{ do } P \text{ od} \equiv while^\top b \text{ do } P \text{ od}$

**definition** *while-bot*  $:: 'α \text{ cond} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while_\perp - do - od)$  **where**  
 $[urel-defs]: while_\perp b \text{ do } P \text{ od} = (\mu X \cdot (P ;; X) \triangleleft b \triangleright_r II)$

While loops with invariant decoration (cf. [1]) – partial correctness.

**definition** *while-inv*  $:: 'α \text{ cond} \Rightarrow 'α \text{ cond} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while - invr - do - od)$  **where**  
 $[urel-defs]: while b \text{ invr } p \text{ do } S \text{ od} = while b \text{ do } S \text{ od}$

While loops with invariant decoration – total correctness.

**definition** *while-inv-bot*  $:: 'α \text{ cond} \Rightarrow 'α \text{ cond} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while_\perp - invr - do - od)$  **where**  
 $[urel-defs]: while_\perp b \text{ invr } p \text{ do } S \text{ od} = while_\perp b \text{ do } S \text{ od}$

While loops with invariant and variant decorations – total correctness.

**definition** *while-vrt*  $::$   
 $'α \text{ cond} \Rightarrow 'α \text{ cond} \Rightarrow (nat, 'α) \text{ uexpr} \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel } (while - invr - vrt - do - od)$  **where**  
 $[urel-defs]: while b \text{ invr } p \text{ vrt } v \text{ do } S \text{ od} = while_\perp b \text{ do } S \text{ od}$

We implement a poor man's version of alphabet restriction that hides a variable within a relation.

**definition** *rel-var-res*  $:: 'α \text{ hrel} \Rightarrow ('a \Longrightarrow 'α) \Rightarrow 'α \text{ hrel } (\text{infix } \upharpoonright_\alpha \ 80)$  **where**  
 $[urel-defs]: P \upharpoonright_\alpha x = (\exists \$x \cdot \exists \$x' \cdot P)$

Alphabet extension and restriction add additional variables by the given lens in both their primed and unprimed versions.

**definition** *rel-aext*  $:: 'β \text{ hrel} \Rightarrow ('β \Longrightarrow 'α) \Rightarrow 'α \text{ hrel}$   
**where**  $[upred-defs]: rel-aext P a = P \oplus_p (a \times_L a)$

**definition** *rel-ares*  $:: 'α \text{ hrel} \Rightarrow ('β \Longrightarrow 'α) \Rightarrow 'β \text{ hrel}$   
**where**  $[upred-defs]: rel-ares P a = (P \upharpoonright_p (a \times a))$

We next describe frames and antiframes with the help of lenses. A frame states that  $P$  defines how variables in  $a$  changed, and all those outside of  $a$  remain the same. An antiframe describes the converse: all variables outside  $a$  are specified by  $P$ , and all those in remain the same. For more information please see [8].

**definition** *frame*  $:: ('a \Longrightarrow 'α) \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel}$  **where**  
 $[urel-defs]: frame a P = (P \wedge \$v' =_u \$v \oplus \$v' \text{ on } \&a)$

**definition** *antiframe*  $:: ('a \Longrightarrow 'α) \Rightarrow 'α \text{ hrel} \Rightarrow 'α \text{ hrel}$  **where**  
 $[urel-defs]: antiframe a P = (P \wedge \$v' =_u \$v' \oplus \$v \text{ on } \&a)$

Frame extension combines alphabet extension with the frame operator to both add additional variables and then frame those.

**definition**  $rel\text{-}fnext :: ('\beta \Rightarrow '\alpha) \Rightarrow '\beta \text{ hrel} \Rightarrow '\alpha \text{ hrel}$  **where**  
 $[upred\text{-}defs]: rel\text{-}fnext\ a\ P = frame\ a\ (rel\text{-}aext\ P\ a)$

The nameset operator can be used to hide a portion of the after-state that lies outside the lens  $a$ . It can be useful to partition a relation's variables in order to conjoin it with another relation.

**definition**  $nameset :: ('a \Rightarrow '\alpha) \Rightarrow '\alpha \text{ hrel} \Rightarrow '\alpha \text{ hrel}$  **where**  
 $[urel\text{-}defs]: nameset\ a\ P = (P \upharpoonright_v \{\$v, \$a'\})$

## 15.3 Syntax Translations

### syntax

-rel-ares P a == CONST rel-ares P a
-rel-frext a P == CONST rel-frext a P

```

The following code sets up pretty-printing for homogeneous relational expressions. We cannot do this via the “translations” command as we only want the rule to apply when the input and output alphabet types are the same. The code has to deconstruct a  $(\alpha, \alpha')$  *uexpr* type, determine that it is relational (product alphabet), and then checks if the types *alpha* and *beta* are the same. If they are, the type is printed as a *hexpr*. Otherwise, we have no match. We then set up a regular translation for the *hrel* type that uses this.

```

print-translation <<
let
fun tr' ctx [ a
  , Const (@{type-syntax prod},-) $ alpha $ beta ] =
  if (alpha = beta)
  then Syntax.const @{type-syntax hexpr} $ a $ alpha
  else raise Match;
in [(@{type-syntax uexpr},tr')]
end
>>

```

#### translations

```
(type) 'α hrel <= (type) (bool, 'α) hexpr
```

### 15.4 Relation Properties

We describe some properties of relations, including functional and injective relations. We also provide operators for extracting the domain and range of a UTP relation.

**definition** *ufunctional* ::  $(\alpha, \alpha') \text{ urel} \Rightarrow \text{bool}$   
**where** [*urel-defs*]: *ufunctional* *R*  $\longleftrightarrow II \sqsubseteq R^-$  ;; *R*

**definition** *uinj* ::  $(\alpha, \alpha') \text{ urel} \Rightarrow \text{bool}$   
**where** [*urel-defs*]: *uinj* *R*  $\longleftrightarrow II \sqsubseteq R$  ;; *R*<sup>-</sup>

**definition** *Dom* ::  $\alpha' \text{ hrel} \Rightarrow \alpha' \text{ upred}$   
**where** [*upred-defs*]: *Dom* *P* =  $[\exists \mathbf{v}' \cdot P]_{<}$

**definition** *Ran* ::  $\alpha' \text{ hrel} \Rightarrow \alpha' \text{ upred}$   
**where** [*upred-defs*]: *Ran* *P* =  $[\exists \mathbf{v} \cdot P]_{>}$

— Configuration for UTP tactics (see *utp-tactics*).

**update-uexpr-rep-eq-thms** — Reread *rep-eq* theorems.

### 15.5 Introduction laws

### 16.3 Noetherian Induction Instantiation

Contribution from Yakoub Nemouchi. The following generalization was used by Tobias Nipkow and Peter Lammich in *Refine\_Monadic*

**lemma** *wf-fixp-uinduct-pure-ueq-gen*:  
**assumes** *fixp-unfold*:  $fp\ B = B\ (fp\ B)$   
**and**  $WF: wf\ R$   
**and** *induct-step*:  

$$\bigwedge f\ st.\ [\bigwedge st'. (st', st) \in R \implies (((Pre \wedge [e]_{<=u} \ll st' \gg) \Rightarrow Post) \sqsubseteq f)]$$

$$\implies fp\ B = f \implies ((Pre \wedge [e]_{<=u} \ll st \gg) \Rightarrow Post) \sqsubseteq (B\ f)$$
  
**shows**  $((Pre \Rightarrow Post) \sqsubseteq fp\ B)$   
**proof** –  
**{** **fix** *st*  
**have**  $((Pre \wedge [e]_{<=u} \ll st \gg) \Rightarrow Post) \sqsubseteq (fp\ B)$   
**using** *WF* **proof** (*induction rule: wf-induct-rule*)  
**case** (*less x*)  
**hence**  $(Pre \wedge [e]_{<=u} \ll x \gg \Rightarrow Post) \sqsubseteq B\ (fp\ B)$   
**by** (*rule induct-step, rel-blast, simp*)  
**then show** *?case*  
**using** *fixp-unfold* **by** *auto*  
**qed**  
**}**  
**thus** *?thesis*  
**by** *pred-simp*  
**qed**

The next lemma shows that using substitution also work. However it is not that generic nor practical for proof automation ...

**lemma** *refine-usubst-to-ueq*:  
 $vwb\text{-}lens\ E \implies (Pre \Rightarrow Post) \llbracket \ll st' \gg / \$E \rrbracket \sqsubseteq f \llbracket \ll st' \gg / \$E \rrbracket = (((Pre \wedge \$E =_u \ll st' \gg) \Rightarrow Post) \sqsubseteq f)$   
**by** (*rel-auto, metis vwb-lens-wb wb-lens.get-put*)

By instantiation of  $\llbracket ?fp\ ?B = ?B\ (?fp\ ?B); wf\ ?R; \bigwedge f\ st.\ [\bigwedge st'. (st', st) \in ?R \implies (?Pre \wedge [?e]_{<=u} \ll st' \gg \Rightarrow ?Post) \sqsubseteq f; ?fp\ ?B = f] \rrbracket \implies (?Pre \wedge [?e]_{<=u} \ll st \gg \Rightarrow ?Post) \sqsubseteq ?B\ f \rrbracket \implies (?Pre \Rightarrow ?Post) \sqsubseteq ?fp\ ?B$  with  $\mu$  and lifting of the well-founded relation we have ...

**lemma** *mu-rec-total-pure-rule*:  
**assumes** *WF*:  $wf\ R$   
**and**  $M: mono\ B$   
**and** *induct-step*:  

$$\bigwedge f\ st.\ [\llbracket (Pre \wedge ([e]_{<=u} \ll st \gg)_u \in_u \ll R \gg \Rightarrow Post) \sqsubseteq f \rrbracket$$

$$\implies \mu\ B = f \implies (Pre \wedge [e]_{<=u} \ll st \gg \Rightarrow Post) \sqsubseteq (B\ f)$$
  
**shows**  $(Pre \Rightarrow Post) \sqsubseteq \mu\ B$   
**proof** (*rule wf-fixp-uinduct-pure-ueq-gen[where fp= $\mu$  and Pre= $Pre$  and B= $B$  and R= $R$  and e= $e$ ]*)  
**show**  $\mu\ B = B\ (\mu\ B)$   
**by** (*simp add: M def-gfp-unfold*)  
**show**  $wf\ R$   
**by** (*fact WF*)

 using upred-lattice.weak-partial-order-axioms by (auto simp add: isotone-def mono-def)

## 19.2 UTP theories hierarchy

**typedef** ( $\mathcal{T}$ ,  $\alpha$ ) *uthy* = *UNIV* :: unit set  
 by auto

We create a unitary parametric type to represent UTP theories. These are merely tags and contain no data other than to help the type-system resolve polymorphic definitions. The two parameters denote the name of the UTP theory – as a unique type – and the minimal alphabet that the UTP theory requires. We will then use Isabelle’s ad-hoc overloading mechanism to associate theory constructs, like healthiness conditions and units, with each of these types. This will allow the type system to retrieve definitions based on a particular theory context.

**definition** *uthy* :: ( $\mathcal{T}$ ,  $\alpha$ ) *uthy* **where**  
*uthy* = *Abs-uthy* ()

**lemma** *uthy-eq* [intro]:  
 fixes  $x \ y$  :: ( $\mathcal{T}$ ,  $\alpha$ ) *uthy*  
 shows  $x = y$   
 by (cases  $x$ , cases  $y$ , simp)

**syntax**  
 $\text{-UTHY} :: \text{type} \Rightarrow \text{type} \Rightarrow \text{logic } (\text{UTHY}'(-, -))$

**translations**  
 $\text{UTHY}(\mathcal{T}, \alpha) == \text{CONST } \text{uthy} :: (\mathcal{T}, \alpha) \text{ uthy}$

We set up polymorphic constants to denote the healthiness conditions associated with a UTP theory. Unfortunately we can currently only characterise UTP theories of homogeneous relations; this is due to restrictions in the instantiation of Isabelle’s polymorphic constants which apparently cannot specialise types in this way.

**consts**  
 $\text{utp-hcond} :: (\mathcal{T}, \alpha) \text{ uthy} \Rightarrow (\alpha \times \alpha) \text{ health } (\mathcal{H}_1)$

**definition** *utp-order* :: ( $\alpha \times \alpha$ ) *health*  $\Rightarrow \alpha$  *hrel gorder* **where**  
 $\text{utp-order } H = (\mid \text{carrier} = \{P. P \text{ is } H\}, \text{eq} = (\text{op } =), \text{le} = \text{op } \sqsubseteq \mid)$

**abbreviation** *uthy-order*  $T \equiv \text{utp-order } \mathcal{H}_T$

Constant *utp-order* obtains the order structure associated with a UTP theory. Its carrier is the set of healthy predicates, equality is HOL equality, and the order is refinement.

**lemma** *utp-order-carrier* [simp]:  
 $\text{carrier } (\text{utp-order } H) = \llbracket H \rrbracket_H$   
 by (simp add: utp-order-def)

**lemma** *utp-order-eq* [*simp*]:  
 $eq (utp-order\ T) = op =$   
**by** (*simp add: utp-order-def*)

**lemma** *utp-order-le* [*simp*]:  
 $le (utp-order\ T) = op \sqsubseteq$   
**by** (*simp add: utp-order-def*)

**lemma** *utp-partial-order*: *partial-order* (*utp-order* *T*)  
**by** (*unfold-locales, simp-all add: utp-order-def*)

**lemma** *utp-weak-partial-order*: *weak-partial-order* (*utp-order* *T*)  
**by** (*unfold-locales, simp-all add: utp-order-def*)

**lemma** *mono-Monotone-utp-order*:  
 $mono\ f \implies Monotone\ (utp-order\ T)\ f$   
**apply** (*auto simp add: isotone-def*)  
**apply** (*metis partial-order-def utp-partial-order*)  
**apply** (*metis monoD*)  
**done**

**lemma** *isotone-utp-orderI*:  $Monotonic\ H \implies isotone\ (utp-order\ X)\ (utp-order\ Y)\ H$   
**by** (*auto simp add: mono-def isotone-def utp-weak-partial-order*)

**lemma** *Mono-utp-orderI*:  
 $\llbracket \bigwedge P\ Q. \llbracket P \sqsubseteq Q; P\ is\ H; Q\ is\ H \rrbracket \implies F(P) \sqsubseteq F(Q) \rrbracket \implies Mono_{utp-order\ H}\ F$   
**by** (*auto simp add: isotone-def utp-weak-partial-order*)

The UTP order can equivalently be characterised as the fixed point lattice, *fpl*.

**lemma** *utp-order-fpl*:  $utp-order\ H = fpl\ \mathcal{P}\ H$   
**by** (*auto simp add: utp-order-def upred-lattice-def fps-def Healthy-def*)

**definition** *uth-eq* ::  $('T_1, '\alpha) uthy \Rightarrow ('T_2, '\alpha) uthy \Rightarrow bool$  (**infix**  $\approx_T$  50) **where**  
 $T_1 \approx_T T_2 \longleftrightarrow \llbracket \mathcal{H}_{T_1} \rrbracket_H = \llbracket \mathcal{H}_{T_2} \rrbracket_H$

**lemma** *uth-eq-refl*:  $T \approx_T T$

**by** (*auto simp add: uth-eq-def*)

**definition** *uthy-plus* ::  $('T_1, '\alpha) uthy \Rightarrow ('T_2, '\alpha) uthy \Rightarrow ('T_1 \times 'T_2, '\alpha) uthy$  (**infixl**  $+_T$  65) **where**  
 $uthy-plus\ T_1\ T_2 = uthy$

**overloading**

$prod-hcond == utp-hcond :: ('T_1 \times 'T_2, '\alpha) uthy \Rightarrow ('\alpha \times '\alpha) health$   
**begin**

The healthiness condition of a relation is simply identity, since every alphabetised relation is healthy.

**definition** *prod-hcond* ::  $('T_1 \times 'T_2, '\alpha) uthy \Rightarrow ('\alpha \times '\alpha) upred \Rightarrow ('\alpha \times '\alpha) upred$  **where**  
 $prod-hcond\ T = \mathcal{H}_{UTHY}('T_1, '\alpha) \circ \mathcal{H}_{UTHY}('T_2, '\alpha)$

end

### 19.3 UTP theory hierarchy

We next define a hierarchy of locales that characterise different classes of UTP theory. Minimally we require that a UTP theory's healthiness condition is idempotent.

```

locale utp-theory =
  fixes  $\mathcal{T} :: ('T, 'a) \text{ uthy } (\mathbf{structure})$ 
  assumes HCond-Idem:  $\mathcal{H}(\mathcal{H}(P)) = \mathcal{H}(P)$ 
begin

```

```

  lemma uthy-simp:
     $\text{uthy} = \mathcal{T}$ 
  by blast

```

A UTP theory fixes  $\mathcal{T}$ , the structural element denoting the UTP theory. All constants associated with UTP theories can then be resolved by the type system.

```

  lemma HCond-Idempotent [closure,intro]: Idempotent  $\mathcal{H}$ 
  by (simp add: Idempotent-def HCond-Idem)

```

```

  sublocale partial-order uthy-order  $\mathcal{T}$ 
  by (unfold-locales, simp-all add: utp-order-def)
end

```

Theory summation is commutative provided the healthiness conditions commute.

```

lemma uthy-plus-comm:
  assumes  $\mathcal{H}_{T_1} \circ \mathcal{H}_{T_2} = \mathcal{H}_{T_2} \circ \mathcal{H}_{T_1}$ 
  shows  $T_1 +_T T_2 \approx_T T_2 +_T T_1$ 
proof –
  have  $T_1 = \text{uthy } T_2 = \text{uthy}$ 
  by blast+
  thus ?thesis
  using assms by (simp add: uth-eq-def prod-hcond-def)

## 19.4 Theory of relations

We can exemplify the creation of a UTP theory with the theory of relations, a trivial theory.

**typeddecl** *REL*

**abbreviation** *REL*  $\equiv$  *UTHY*(*REL*, ' $\alpha$ )

We declare the type *REL* to be the tag for this theory. We need know nothing about this type (other than it's non-empty), since it is merely a name. We also create the corresponding constant to refer to the theory. Then we can use it to instantiate the relevant polymorphic constants.

**overloading**

*rel-hcond* == *utp-hcond* :: (*REL*, ' $\alpha$ ) *uthy*  $\Rightarrow$  (' $\alpha$   $\times$  ' $\alpha$ ) *health*

*rel-unit* == *utp-unit* :: (*REL*, ' $\alpha$ ) *uthy*  $\Rightarrow$  ' $\alpha$  *hrel*

**begin**

The healthiness condition of a relation is simply identity, since every alphabetised relation is healthy.

**definition** *rel-hcond* :: (*REL*, ' $\alpha$ ) *uthy*  $\Rightarrow$  (' $\alpha$   $\times$  ' $\alpha$ ) *upred*  $\Rightarrow$  (' $\alpha$   $\times$  ' $\alpha$ ) *upred* **where**  
[*upred-defs*]: *rel-hcond* *T* = *id*

The unit of the theory is simply the relational unit.

**definition** *rel-unit* :: (*REL*, ' $\alpha$ ) *uthy*  $\Rightarrow$  ' $\alpha$  *hrel* **where**  
[*upred-defs*]: *rel-unit* *T* = *II*

**end**

Finally we can show that relations are a monotone and unital theory using a locale interpretation, which requires that we prove all the relevant properties. It's convenient to rewrite some of the theorems so that the provisos are more UTP like; e.g. that the carrier is the set of healthy predicates.

**interpretation** *rel-theory*: *utp-theory-mono-unital REL*

**rewrites** *carrier* (*uthy-order REL*) =  $\llbracket id \rrbracket_H$

**by** (*unfold-locales*, *simp-all add: rel-hcond-def rel-unit-def Healthy-def*)

We can then, for instance, determine what the top and bottom of our new theory is.

**lemma** *REL-top*:  $\top_{REL} = false$

**by** (*simp add: rel-theory.healthy-top*, *simp add: rel-hcond-def*)

**lemma** *REL-bottom*:  $\perp_{REL} = true$

**by** (*simp add: rel-theory.healthy-bottom*, *simp add: rel-hcond-def*)

A number of theorems have been exported, such at the fixed point unfolding laws.

**thm** *rel-theory.GFP-unfold*

## 19.5 Theory links

We can also describe links between theories, such a Galois connections and retractions, using the following notation.

**definition** *mk-conn* ( $- \Leftarrow \langle -, - \rangle \Rightarrow -$  [*90*,*0*,*0*,*91*] *91*) **where**

$H1 \Leftarrow \langle \mathcal{H}_1, \mathcal{H}_2 \rangle \Rightarrow H2 \equiv (\mid \text{order}A = \text{utp-order } H1, \text{order}B = \text{utp-order } H2, \text{lower} = \mathcal{H}_2, \text{upper} = \mathcal{H}_1 \mid)$

**abbreviation**  $\text{mk-conn}' (- \Leftarrow \langle -, - \rangle \rightarrow - [90, 0, 0, 91] \ 91)$  **where**

$T1 \Leftarrow \langle \mathcal{H}_1, \mathcal{H}_2 \rangle \rightarrow T2 \equiv \mathcal{H}_{T1} \Leftarrow \langle \mathcal{H}_1, \mathcal{H}_2 \rangle \Rightarrow \mathcal{H}_{T2}$

**lemma**  $\text{mk-conn-order}A$   $[simp]: \mathcal{X}_{H1} \Leftarrow \langle \mathcal{H}_1, \mathcal{H}_2 \rangle \Rightarrow H2 = \text{utp-order } H1$   
**by**  $(\text{simp add: mk-conn-def})$

**lemma**  $\text{mk-conn-order}B$   $[simp]: \mathcal{Y}_{H1} \Leftarrow \langle \mathcal{H}_1, \mathcal{H}_2 \rangle \Rightarrow H2 = \text{utp-order } H2$   
**by**  $(\text{simp add: mk-conn-def})$

## 23 Concurrent Programming

**theory** *utp-concurrency*

**imports**

*utp-hoare*

*utp-rel*

*utp-tactics*

*utp-theory*

**begin**

In this theory we describe the UTP scheme for concurrency, *parallel-by-merge*, which provides a general parallel operator parametrised by a “merge predicate” that explains how to merge the after states of the composed predicates. It can thus be applied to many languages and concurrency schemes, with this theory providing a number of generic laws. The operator is explained in more detail in Chapter 7 of the UTP book [5].

## 23.1 Variable Renamings

In parallel-by-merge constructions, a merge predicate defines the behaviour following execution of of parallel processes,  $P \parallel Q$ , as a relation that merges the output of  $P$  and  $Q$ . In order to achieve this we need to separate the variable values output from  $P$  and  $Q$ , and in addition the variable values before execution. The following three constructs do these separations. The initial state-space before execution is  $'\alpha$ , the final state-space after the first parallel process is  $'\beta_0$ , and the final state-space for the second is  $'\beta_1$ . These three functions lift variables on these three state-spaces, respectively.

**alphabet**  $('\alpha, '\beta_0, '\beta_1) \text{ mrg} =$   
 $\text{mrg-prior} :: '\alpha$   
 $\text{mrg-left} :: '\beta_0$

 by (simp add: pre-uvar-def)

## 23.2 Merge Predicates

A merge predicate is a relation whose input has three parts: the prior variables, the output variables of the left predicate, and the output of the right predicate.

**type-synonym**  $'\alpha \text{ merge} = (('\alpha, '\alpha, '\alpha) \text{ mrg}, '\alpha) \text{ urel}$

skip is the merge predicate which ignores the output of both parallel predicates

**definition**  $\text{skip}_m :: '\alpha \text{ merge}$  **where**  
 $[\text{upred-defs}]: \text{skip}_m = (\$ \mathbf{v}' =_u \$ \mathbf{v}_<)$

swap is a predicate that the swaps the left and right indices; it is used to specify commutativity of the parallel operator

**definition**  $\text{swap}_m :: (('\alpha, '\beta, '\beta) \text{ mrg}) \text{ hrel}$  **where**  
 $[\text{upred-defs}]: \text{swap}_m = (0 - \mathbf{v}, 1 - \mathbf{v}) := (\& 1 - \mathbf{v}, \& 0 - \mathbf{v})$

A symmetric merge is one for which swapping the order of the merged concurrent predicates has no effect. We represent this by the following healthiness condition that states that  $swap_m$  is a left-unit.

**abbreviation**  $SymMerge :: 'α \ merge \Rightarrow 'α \ merge$  **where**  
 $SymMerge(M) \equiv (swap_m ;; M)$

### 23.3 Separating Simulations

$U0$  and  $U1$  are relations modify the variables of the input state-space such that they become indexed with 0 and 1, respectively.

**definition**  $U0 :: ('β_0, ('α, 'β_0, 'β_1) \ mrg) \ urel$  **where**  
 $[upred-defs]: U0 = (\$0 - \mathbf{v}' =_u \$\mathbf{v})$

**definition**  $U1 :: ('β_1, ('α, 'β_0, 'β_1) \ mrg) \ urel$  **where**  
 $[upred-defs]: U1 = (\$1 - \mathbf{v}' =_u \$\mathbf{v})$

**lemma**  $U0\text{-}swap: (U0 ;; swap_m) = U1$   
**by**  $(rel\text{-}auto)$

**lemma**  $U1\text{-}swap: (U1 ;; swap_m) = U0$   
**by**  $(rel\text{-}auto)$

As shown below, separating simulations can also be expressed using the following two alphabet extrusions

**definition**  $U0\alpha$  **where**  $[upred-defs]: U0\alpha = (1_L \times_L \ mrg\text{-}left)$

**definition**  $U1\alpha$  **where**  $[upred-defs]: U1\alpha = (1_L \times_L \ mrg\text{-}right)$

We then create the following intuitive syntax for separating simulations.

**abbreviation**  $U0\text{-}\alpha\text{-}lift \ (\lceil - \rceil_0)$  **where**  $\lceil P \rceil_0 \equiv P \oplus_p U0\alpha$

**abbreviation**  $U1\text{-}\alpha\text{-}lift \ (\lceil - \rceil_1)$  **where**  $\lceil P \rceil_1 \equiv P \oplus_p U1\alpha$

$\lceil P \rceil_0$  is predicate  $P$  where all variables are indexed by 0, and  $\lceil P \rceil_1$  is where all variables are indexed by 1. We can thus equivalently express separating simulations using alphabet extrusion.

**lemma**  $U0\text{-}\alpha\text{-}as\text{-}\alpha: (P ;; U0) = \lceil P \rceil_0$   
**by**  $(rel\text{-}auto)$

**lemma**  $U1\text{-}\alpha\text{-}as\text{-}\alpha: (P ;; U1) = \lceil P \rceil_1$   
**by**  $(rel\text{-}auto)$

**lemma**  $U0\alpha\text{-}vwb\text{-}lens \ [simp]: vwb\text{-}lens \ U0\alpha$   
**by**  $(simp \ add: U0\alpha\text{-}def \ id\text{-}vwb\text{-}lens \ prod\text{-}vwb\text{-}lens)$

**lemma**  $U1\alpha\text{-}vwb\text{-}lens \ [simp]: vwb\text{-}lens \ U1\alpha$   
**by**  $(simp \ add: U1\alpha\text{-}def \ id\text{-}vwb\text{-}lens \ prod\text{-}vwb\text{-}lens)$

**lemma**  $U0\alpha\text{-}indep\text{-}right\text{-}uvar \ [simp]: vwb\text{-}lens \ x \Longrightarrow U0\alpha \bowtie out\text{-}var \ (right\text{-}uvar \ x)$   
**by**  $(force \ intro: plus\text{-}pres\text{-}lens\text{-}indep \ fst\text{-}snd\text{-}lens\text{-}indep \ lens\text{-}indep\text{-}left\text{-}comp$

## 23.4 Associative Merges

Associativity of a merge means that if we construct a three way merge from a two way merge and then rotate the three inputs of the merge to the left, then we get exactly the same three way merge back.

We first construct the operator that constructs the three way merge by effectively wiring up the two way merge in an appropriate way.

**definition** *ThreeWayMerge* ::  $'\alpha \text{ merge} \Rightarrow (((' \alpha, ' \alpha, (' \alpha, ' \alpha, ' \alpha) \text{ mrg}) \text{ mrg}, ' \alpha) \text{ urel } (\mathbf{M3}'(-)))$  **where**  
*[upred-defs]:* *ThreeWayMerge*  $M = ((\$0-\mathbf{v}' =_u \$0-\mathbf{v} \wedge \$1-\mathbf{v}' =_u \$1-\mathbf{v} \wedge \$\mathbf{v}_{<} =_u \$\mathbf{v}_{<}) ;; M ;; U0 \wedge \$1-\mathbf{v}' =_u \$1-\mathbf{v} \wedge \$\mathbf{v}_{<} =_u \$\mathbf{v}_{<}) ;; M$

The next definition rotates the inputs to a three way merge to the left one place.

**abbreviation**  $rotate_m$  **where**  $rotate_m \equiv (0-v, 1-0-v, 1-1-v) := (\&1-0-v, \&1-1-v, \&0-v)$

Finally, a merge is associative if rotating the inputs does not effect the output.

**definition**  $AssocMerge :: 'a \text{ merge} \Rightarrow bool$  **where**  
 $[upred-defs]: AssocMerge\ M = (rotate_m ;; \mathbf{M}\mathcal{P}(M) = \mathbf{M}\mathcal{P}(M))$

## 23.5 Parallel Operators

We implement the following useful abbreviation for separating of two parallel processes and copying of the before variables, all to act as input to the merge predicate.

**abbreviation**  $par\_sep$  (infixr  $\parallel_s$  85) **where**  
 $P \parallel_s Q \equiv (P ;; U0) \wedge (Q ;; U1) \wedge \$v_{<}' =_u \$v$

The following implementation of parallel by merge is less general than the book version, in that it does not properly partition the alphabet into two disjoint segments. We could actually achieve this specifying lenses into the larger alphabet, but this would complicate the definition of programs. May reconsider later.

**definition**  
 $par\_by\_merge :: ('a, 'b) \text{ urel} \Rightarrow (('a, 'b, 'c) \text{ mrg}, 'd) \text{ urel} \Rightarrow ('a, 'c) \text{ urel} \Rightarrow ('a, 'd) \text{ urel}$   
 $(- \parallel_s - [85, 0, 86] 85)$   
**where**  $[upred-defs]: P \parallel_M Q = (P \parallel_s Q ;; M)$

**lemma**  $par\_by\_merge\_alt\_def: P \parallel_M Q = ([P]_0 \wedge [Q]_1 \wedge \$v_{<}' =_u \$v) ;; M$   
**by** ( $simp\ add: par\_by\_merge\_def\ U0-as-alpha\ U1-as-alpha$ )

**lemma**  $shEx-pbm-left: ((\exists x \cdot P\ x) \parallel_M Q) = (\exists x \cdot (P\ x \parallel_M Q))$   
**by** ( $rel-auto$ )

**lemma**  $shEx-pbm-right: (P \parallel_M (\exists x \cdot Q\ x)) = (\exists x \cdot (P \parallel_M Q\ x))$   
**by** ( $rel-auto$ )

## 23.6 Unrestriction Laws

**lemma**  $unrest-in-par-by-merge [unrest]:$   
 $\llbracket \$x \# P; \$x_{<} \# M; \$x \# Q \rrbracket \Longrightarrow \$x \# P \parallel_M Q$   
**by** ( $rel-auto, fastforce+$ )

**lemma**  $unrest-out-par-by-merge [unrest]:$   
 $\llbracket \$x' \# M \rrbracket \Longrightarrow \$x' \# P \parallel_M Q$   
**by** ( $rel-auto$ )

## 23.7 Substitution laws

Substitution is a little tricky because when we push the expression through the composition operator the alphabet of the expression must also change. Consequently for now we only support literal substitution, though this could be generalised with suitable alphabet coercions. We need quite a number of variants to support this which are below.

**lemma**  $U0-seq-subst: (P ;; U0) \llbracket \langle v \rangle / \$0-x' \rrbracket = (P \llbracket \langle v \rangle / \$x' \rrbracket ;; U0)$   
**by** ( $rel-auto$ )

**lemma**  $U1-seq-subst: (P ;; U1) \llbracket \langle v \rangle / \$1-x' \rrbracket = (P \llbracket \langle v \rangle / \$x' \rrbracket ;; U1)$   
**by** ( $rel-auto$ )

**lemma** *lit-pbm-subst* [*usubst*]:

## 24.1 Local Variables

**theory** *utp-local*

**imports**

*utp-rel-laws*

*utp-meta-subst*

*utp-theory*

**begin**

## 24.2 Preliminaries

The following type is used to augment that state-space with a stack of local variables represented as a list in the special variable *store*. Local variables will be represented by pushing variables onto the stack, and popping them off after use. The element type of the stack is  $'u$  which corresponds to a suitable injection universe.

**alphabet**  $'u \text{ local} =$

$\text{store} :: 'u \text{ list}$

State-space with a countable universe for local variables.

**type-synonym**  $'a \text{ clocal} = (\text{nat}, 'a) \text{ local-scheme}$

The following predicate wraps the relation with assumptions that the stack has a particular size before and after execution.

**definition** *local-num* **where**

*local-num*  $n$   $P = [\#_u(\&store) =_u \ll n \gg]^\top \;; P \;; [\#_u(\&store) =_u \ll n \gg]^\top$

**declare** *inj-univ.from-univ-def* [*upred-defs*]

**declare** *inj-univ.to-univ-lens-def* [*upred-defs*]

**declare** *nat-inj-univ-def* [*upred-defs*]

### 24.3 State Primitives

The following record is used to characterise the UTP theory specific operators we require in order to create the local variable operators.

**record** ( $'\alpha$ ,  $'s$ ) *state-prim* =

— The first field states where in the alphabet  $'\alpha$  the user state-space type is  $'s$  is located with the form of a lens.

*sstate*  $:: 's \Rightarrow '\alpha$  (**sl**)

— The second field is the theory's substitution operator. It takes a substitution over the state-space type and constructs a homogeneous assignment relation.

*sassigns*  $:: 's$  *usubst*  $\Rightarrow '\alpha$  *hrel* ( $\langle \cdot \rangle_1$ )

**syntax**

*-sstate*  $:: \text{logic} \Rightarrow \text{svid}$  (**sl**)

**translations**

*-sstate*  $T \Rightarrow \text{CONST } \text{sstate } T$

The following record type adds an injection universe  $'u$  to the above operators. This is needed because the stack has a homogeneous type into which we must inject type variable bindings. The universe can be any Isabelle type, but must satisfy the axioms of the locale *inj-univ*, which broadly shows the injectable values permitted.

**record** ( $'\alpha$ ,  $'s$ ,  $'u$ ,  $'a$ ) *local-prim* = ( $'\alpha$ , ( $'u$ ,  $'s$ ) *local-scheme*) *state-prim* +

*inj-local*  $:: ('a, 'u)$  *inj-univ*

The following locales give the assumptions required of the above signature types. The first gives the defining axioms for state-spaces. State-space lens **s** must be a very well-behaved lens, and sequential composition of assignments corresponds to functional composition of the underlying substitutions. TODO: We might also need operators to properly handle framing in the future.

**locale** *utp-state* =

**fixes**  $S$  (**structure**)

**assumes** *vwb-lens* **s**

**and** *passigns-comp*: ( $\langle \sigma \rangle \;; \langle \varrho \rangle$ ) =  $\langle \varrho \circ \sigma \rangle$

The next locale combines the axioms of a state-space and an injection universe structure. It then uses the required constructs to create the local variable operators.

**locale** *utp-local-state* = *utp-state*  $S$  + *inj-univ* *inj-local*  $S$  **for**  $S :: ('\alpha, 's, 'u::\text{two}, 'a)$  *local-prim* (**structure**)

**begin**

The following two operators represent opening and closing a variable scope, which is implemented by pushing an arbitrary initial value onto the stack, and popping it off, respectively.

**definition**  $var-open :: 'α \ hrel \ (open_v) \ \mathbf{where}$   
 $var-open = (\bigcap \ v \cdot \langle [store \mapsto_s (\&store \hat{\ }_u \langle \ll v \gg)] \rangle)$

**definition**  $var-close :: 'α \ hrel \ (close_v) \ \mathbf{where}$   
 $var-close = \langle [store \mapsto_s front_u(\&store) \triangleleft \#_u(\&store) \triangleright_u 0 \triangleright \&store] \rangle$

The next operator is an expression that returns a lens pointing to the top of the stack. This is effectively a dynamic lens, since where it points to depends on the initial number of variables on the stack.

**definition**  $top-var :: ('a \implies ('u, 'b) \ local-scheme, 'α) \ uexpr \ (top_v) \ \mathbf{where}$   
 $top-var = \ll \lambda \ l. \ to-univ-lens \ ;_L \ list-lens \ l \ ;_L \ store \gg (\#_u(\&s:store) - 1)_a$

Finally, we combine the above operators to represent variable scope. This is a kind of binder which takes a homogeneous relation, parametric over a lens, and returns a relation. It simply opens the variable scope, substitutes the top variable into the body, and then closes the scope afterwards.

**definition**  $var-scope :: (('a \implies ('u, 's) \ local-scheme) \Rightarrow 'α \ hrel) \Rightarrow 'α \ hrel \ \mathbf{where}$   
 $var-scope \ f = open_v \ ; \ f(x) \ll x \mapsto [top_v]_{<} \ ; \ close_v$

**end**

**notation**  $utp-local-state.var-open \ (open[-])$

**notation**  $utp-local-state.var-close \ (close[-])$

**notation**  $utp-local-state.var-scope \ (\mathcal{V}[-, / -])$

**notation**  $utp-local-state.top-var \ (top[-])$

**syntax**

$-var-scope \quad :: \ logic \Rightarrow id \Rightarrow logic \Rightarrow logic \ (var[-] \ - \cdot \cdot \ [0, 0, 10] \ 10)$

$-var-scope-type \ :: \ logic \Rightarrow id \Rightarrow type \Rightarrow logic \Rightarrow logic \ (var[-] \ - :: \cdot \cdot \cdot \ [0, 0, 0, 10] \ 10)$

**translations**

$-var-scope \ T \ x \ P == CONST \ utp-local-state.var-scope \ T \ (\lambda \ x. \ P)$

$-var-scope-type \ T \ x \ t \ P ==> CONST \ utp-local-state.var-scope \ T \ (-abs \ (-constrain \ x \ (-uvar-ty \ t)) \ P)$

Next, we prove a collection of important generci laws about variable scopes using the axioms defined above.

## 24.4 Relational State Spaces

To illustrate the above technique, we instantiate it for relations with a *nat* as the universe type. The following definition defines the state-space location, assignment operator, and injection universe for this.

**definition** *rel-local-state* ::  
 $'a::\text{countable}$  *itself*  $\Rightarrow ((\text{nat}, 's) \text{ local-scheme}, 's, \text{nat}, 'a::\text{countable}) \text{ local-prim}$  **where**  
 $\text{rel-local-state } t = \langle \text{sstate} = 1_L, \text{sassigns} = \text{assigns-r}, \text{inj-local} = \text{nat-inj-univ} \rangle$

**abbreviation** *rel-local* ( $R_l$ ) **where**  
 $\text{rel-local} \equiv \text{rel-local-state } \text{TYPE}('a::\text{countable})$

**syntax**  
 $\text{-rel-local-state-type} :: \text{type} \Rightarrow \text{logic } (R_l[-])$

**translations**  
 $\text{-rel-local-state-type } a \Rightarrow \text{CONST rel-local-state } (-\text{TYPE } a)$

**lemma** *get-rel-local* [*lens-defs*]:  
 $\text{gets}_{R_l} = \text{id}$   
**by** (*simp add*: *rel-local-state-def lens-defs*)

**lemma** *rel-local-state* [*simp*]:  $\text{utp-local-state } R_l$   
**by** (*unfold-locales, simp-all add*: *upred-defs assign-comp rel-local-state-def*)

**lemma** *sassigns-rel-state* [*simp*]:  $\langle \sigma \rangle_{R_l} = \langle \sigma \rangle_a$   
**by** (*simp add*: *rel-local-state-def*)

**syntax**  
 $\text{-rel-var-scope} \quad :: \text{id} \Rightarrow \text{logic} \Rightarrow \text{logic } (\text{var } - \cdot - [0, 10] \ 10)$   
 $\text{-rel-var-scope-type} :: \text{id} \Rightarrow \text{type} \Rightarrow \text{logic} \Rightarrow \text{logic } (\text{var } - :: - \cdot - [0, 0, 10] \ 10)$

**translations**  
 $\text{-rel-var-scope } x \ P \Rightarrow \text{-var-scope } R_l \ x \ P$   
 $\text{-rel-var-scope-type } x \ t \ P \Rightarrow \text{-var-scope-type } (-\text{rel-local-state-type } t) \ x \ t \ P$

Next we prove some examples laws.

```

lemma rel-var-ex-1: (var x :: string • II) = II
  by (rel-auto')

lemma rel-var-ex-2: (var x • x := 1) = II
