

Stateful-Failure Reactive Designs in Isabelle/UTP

Simon Foster James Baxter Ana Cavalcanti Jim Woodcock

July 24, 2019

Abstract

Stateful-Failure Reactive Designs specialise reactive design contracts with failures traces, as present in languages like CSP and Circus. A failure trace consists of a sequence of events and a refusal set. It intuitively represents a quiescent observation, where certain events have previously occurred, and others are currently being accepted. Following the UTP book, we add an observational variable to represent refusal sets, and healthiness conditions that ensure their well-formedness. Using these, we also specialise our theory of reactive relations with operators to characterise both completed and quiescent interactions, and an accompanying equational theory. We use these to define the core operators — including assignment, event occurrence, and external choice — and specialise our proof strategy to support these. We also demonstrate a link with the CSP failures-divergences semantic model.

1 Introduction

This document contains a mechanisation in Isabelle/UTP [1] of an specialisation of stateful reactive designs with refusal information, as present in languages like Circus [2].

2 Stateful-Failure Core Types

```
theory utp-sfrd-core
  imports UTP-Reactive-Designs.utp-rea-designs
begin
```

2.1 SFRD Alphabet

```
alphabet ('σ, 'φ) sfrd-vars = ('φ list, 'σ) rsp-vars +
  ref :: 'φ set
```

The following two locale interpretations are a technicality to improve the behaviour of the automatic tactics. They enable (re)interpretation of state spaces in order to remove any occurrences of lens types, replacing them by tuple types after the tactics *pred-simp* and *rel-simp* are applied. Eventually, it would be desirable to automate preform these interpretations automatically as part of the **alphabet** command.

```
type-synonym ('σ, 'φ) sfrd = ('σ, 'φ) sfrd-vars
type-synonym ('σ, 'φ) action = ('σ, 'φ) sfrd hrel
type-synonym 'φ csp = (unit, 'φ) sfrd
type-synonym 'φ process = 'φ csp hrel
```

There is some slight imprecision with the translations, in that we don't bother to check if the trace event type and refusal set event types are the same. Essentially this is because its very difficult to construct processes where this would be the case. However, it may be better to add a proper ML print translation in the future.

translations

```
(type) ('σ, 'φ) sfrd <= (type) ('σ, 'φ) sfrd-vars
(type) ('σ, 'φ) action <= (type) ('σ, 'φ) sfrd hrel
(type) 'φ process <= (type) (unit, 'φ) action
```

notation *sfrd-vars.more_L* (Σ_C)

```
declare des-vars.splits [alpha-splits del]
declare rp-vars.splits [alpha-splits del]
declare des-vars.splits [alpha-splits del]
declare rsp-vars.splits [alpha-splits del]
declare rsp-vars.splits [alpha-splits]
declare rp-vars.splits [alpha-splits]
declare des-vars.splits [alpha-splits]
```

2.2 Basic laws

```
lemma R2c-tr-ext: R2c ($tr' =_u $tr ^_u <[a]_{S<}>) = ($tr' =_u $tr ^_u <[a]_{S<}>)
  by (rel-auto)
```

lemma *circus-alpha-bij-lens*:

```
bij-lens ({ $ok, $ok', $wait, $wait', $tr, $tr', $st, $st', $ref, $ref' }_α :: - ==> ('s, 'e) sfrd × ('s, 'e) sfrd)
  by (unfold-locales, lens-simp+)
```

2.3 Unrestriction laws

```
lemma pre-unrest-ref [unrest]: $ref # P ==> $ref # pre_R(P)
  by (simp add: pre_R-def unrest)
```

5 Definitions

We here define extra healthiness conditions for stateful-failure reactive designs.

abbreviation $CSP1 :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health}$
where $CSP1(P) \equiv RD1(P)$

abbreviation $CSP2 :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health}$
where $CSP2(P) \equiv RD2(P)$

abbreviation $CSP :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health}$
where $CSP(P) \equiv SRD(P)$

definition $STOP :: \varphi \text{ process where}$
 $[upred-defs]: STOP = CSP1(\$ok' \wedge R3c(\$tr' =_u \$tr \wedge \$wait'))$

definition $SKIP :: \varphi \text{ process where}$
 $[upred-defs]: SKIP = \mathbf{R}_s(\exists \$ref \cdot CSP1(II))$

definition $Stop :: (\sigma, \varphi) \text{ action where}$
 $[upred-defs]: Stop = \mathbf{R}_s(true \vdash (\$tr' =_u \$tr \wedge \$wait'))$

definition $Skip :: (\sigma, \varphi) \text{ action where}$
 $[upred-defs]: Skip = \mathbf{R}_s(true \vdash (\$tr' =_u \$tr \wedge \neg \$wait' \wedge \$st' =_u \$st))$

definition $CSP3 :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health where}$
 $[upred-defs]: CSP3(P) = (Skip ;; P)$

definition $CSP4 :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health where}$
 $[upred-defs]: CSP4(P) = (P ;; Skip)$

definition $NCSP :: ((\sigma, \varphi) \text{ sfrd} \times (\sigma, \varphi) \text{ sfrd}) \text{ health where}$
 $[upred-defs]: NCSP = CSP3 \circ CSP4 \circ CSP$

Productive and normal processes

abbreviation $PCSP \equiv Productive \circ NCSP$

Instantaneous and normal processes

abbreviation $ICSP \equiv ISRD1 \circ NCSP$

5.1 Healthiness condition properties

$SKIP$ is the same as $Skip$, and $STOP$ is the same as $Stop$, when we consider stateless CSP processes. This is because any reference to the st variable degenerates when the alphabet type coerces its type to be empty. We therefore need not consider $SKIP$ and $STOP$ actions.

theorem $SKIP\text{-is-Skip}$ $[simp]: SKIP = Skip$
by $(rel\text{-auto})$

theorem $STOP\text{-is-Stop}$ $[simp]: STOP = Stop$

8.8 Assignment with update

There are different collections that we would like to assign to, but they all have different types and perhaps more importantly different conditions on the update being well defined. For example, for a list well-definedness equates to the index being less than the length etc. Thus we here set up a polymorphic constant for CSP assignment updates that can be specialised to different types.

definition *AssignCSP-update* ::

$(f \Rightarrow k\ \text{set}) \Rightarrow (f \Rightarrow k \Rightarrow v \Rightarrow f) \Rightarrow (f \Rightarrow \sigma) \Rightarrow$

$(k, \sigma)\ uexpr \Rightarrow (v, \sigma)\ uexpr \Rightarrow (\sigma, \varphi)\ \text{action}\ \mathbf{where}$

[upred-defs, rdes-def]: *AssignCSP-update* domf updatef $x\ k\ v =$

$\mathbf{R}_s([k \in_u uop\ \text{domf}\ (\&x)]_{S<} \vdash false \diamond \Phi(true, [x \mapsto_s trop\ \text{updatef}\ (\&x)\ k\ v], \langle \rangle))$

All different assignment updates have the same syntax; the type resolves which implementation to use.

syntax

$\text{-csp-assign-upd} :: \text{svid} \Rightarrow \text{uexp} \Rightarrow \text{uexp} \Rightarrow \text{logic}\ (-[-] :=_C - [61, 0, 62]\ 62)$

translations

$\text{-csp-assign-upd}\ x\ k\ v == \text{CONST}\ \text{AssignCSP-update}\ (\text{CONST}\ \text{uom})\ (\text{CONST}\ \text{uupd})\ x\ k\ v$

lemma *AssignCSP-update-CSP* [closure]:

10.1 Failures-Divergences Semantics

The following functions play a similar role to those in Roscoe's CSP semantics, and are calculated from the Circus reactive design semantics. A major difference is that these three functions account for state. Each divergence, trace, and failure is subject to an initial state. Moreover, the traces are terminating traces, and therefore also provide a final state following the given interaction. A more subtle difference from the Roscoe semantics is that the set of traces do not include the divergences. The same semantic information is present, but we construct a direct analogy with the pre-, peri- and postconditions of our reactive designs.

10.3 Deadlock Freedom

The following is a specification for deadlock free actions. In any intermediate observation, there must be at least one enabled event.

definition *CDF :: ('s, 'e) action where*
 $[rdes-def]: CDF = \mathbf{R}_s(true_r \vdash (\bigcap (s, t, E, e) \cdot \mathcal{E}(\langle s \rangle, \langle t \rangle, \langle insert\ e\ E \rangle))) \diamond true_r$

lemma *CDF-NCSP [closure]: CDF is NCSP*
apply (*simp add: CDF-def*)
apply (*rule NCSP-rdes-intro*)
apply (*simp-all add: closure unrest*)
done

```

lemma CDF-seq-idem:  $CDF \;; CDF = CDF$ 
  by (rdes-eq)

lemma CDF-refine-intro:  $CDF \sqsubseteq P \implies CDF \sqsubseteq (CDF \;; P)$ 
  by (metis CDF-seq-idem urel-diod.mult-isol)

lemma Skip-deadlock-free:  $CDF \sqsubseteq \text{Skip}$ 
  by (rdes-refine)

lemma CDF-ext-st [alpha]:  $CDF \oplus_p \text{abs-st}_L = CDF$ 
  by (rdes-eq)

end

```
