

Reactive Designs in Isabelle/UTP

Simon Foster James Baxter Ana Cavalcanti Jim Woodcock
Samuel Canham

March 15, 2019

Abstract

Reactive designs combine the UTP theories of reactive processes and designs to characterise reactive programs. Whereas sequential imperative programs are expected to run until termination, reactive programs pause at instances to allow interaction with the environment using abstract events, and often do not terminate at all. Thus, whereas a design describes the precondition and postcondition for a program, to characterise initial and final states, a reactive design also has a “pericondition”, which characterises intermediate quiescent observations. This gives rise to a notion of “reactive contract”, which specifies the assumptions a program makes of its environment, and the guarantees it will make of its own behaviour in both intermediate and final observations. This Isabelle/UTP document mechanises the UTP theory of reactive designs, including its healthiness conditions, signature, and a large library of algebraic laws of reactive programming.

1 Introduction

This document contains a mechanisation in Isabelle/UTP [2] of our theory of reactive designs. Reactive designs form an important semantic foundation for reactive modelling languages such as Circus [3]. For more details of this work, please see our recent paper [1].

2.2 Identities

We define two identities for reactive designs, which correspond to the regular and state-sensitive versions of reactive designs, respectively. The former is the one used in the UTP book and related publications for CSP.

definition $skip_rea :: ('t::trace, 'α) hrel_rp (II_C)$ **where**
 $skip_rea_def \ [urel_defs]: II_C = (II \vee (\neg \$ok \wedge \$tr \leq_u \$tr'))$

definition $skip_srea :: ('s, 't::trace, 'α) hrel_rsp (II_R)$ **where**
 $skip_srea_def \ [urel_defs]: II_R = ((\exists \$st \cdot II_C) \triangleleft \$wait \triangleright II_C)$

RD3 reactive designs are those whose assumption can be written as a conjunction of a precondition on (undashed) program variables, and a negated statement about the trace. The latter allows us to state that certain events must not occur in the trace – which are effectively safety properties.

6 Syntax for reactive design contracts

```

theory utp-rdes-contracts
imports utp-rdes-normal
begin

```

We give an experimental syntax for reactive design contracts $[P \vdash Q|R]_R$, where *P* is a precondition on undashed state variables only, *Q* is a pericondition that can refer to the trace and before state but not the after state, and *R* is a postcondition. Both *Q* and *R* can refer only to the trace contribution through a HOL variable *trace* which is bound to $\&tt$.

definition *mk-RD* :: 's upred \Rightarrow ('t::trace \Rightarrow 's upred) \Rightarrow ('t \Rightarrow 's hrel) \Rightarrow ('s, 't, 'a) hrel-rsp **where**
mk-RD *P* *Q* *R* = $\mathbf{R}_s([\![P]\!]_{S<} \vdash [\![Q(x)]\!]_{S<} [\![x \rightarrow \&tt]\!] \diamond [\![R(x)]\!]_S [\![x \rightarrow \&tt]\!]])$

definition *trace-pred* :: ('t::trace \Rightarrow 's upred) \Rightarrow ('s, 't, 'α) hrel-rsp **where**
[upred-defs]: *trace-pred* *P* = $[\![P\ x]\!]_{S<} [\![x \rightarrow \&tt]\!]$

syntax

```

10 Guarded Recursion

```

theory utp-rdes-guarded
imports utp-rdes-productive
begin

```

10.1 Traces with a size measure

Guarded recursion relies on our ability to measure the trace's size, in order to see if it is decreasing on each iteration. Thus, we here equip the trace algebra with the *size* function that provides this.

```

class size-trace = trace + size +
assumes

```

```

  size-zero:  $size\ 0 = 0$  and
  size-nzero:  $s > 0 \implies size(s) > 0$  and
  size-plus:  $size\ (s + t) = size(s) + size(t)$ 

```

— These axioms may be stronger than necessary. In particular, $(0::'a) < ?s \implies 0 < size\ ?s$ requires that a non-empty trace have a positive size. But this may not be the case with all trace models and is possibly more restrictive than necessary. In future we will explore weakening.

```
